PROJECT: 06262044.0000

20 August 2015

NARRATIVE

This narrative describes the analysis of nineteen urine samples for selected hydroxy metabolites of poly aromatic hydrocarbons (PAHs) using high-resolution gas chromatography / high-resolution mass spectrometry (HRGC / HRMS).

SAMPLE RECEIPT and STORAGE

The samples were received on the 29th May 2015. Details of sample conditions on receipt are provided on the sample receiving record. As per instructions from ARCADIS: Day 14 urine sample for each test group was combined with the Day 15 urine sample for each test group. The combined urine samples were assigned AXYS ID L23368-1 to -24. Sample compositing was conducted in workgroup WG51568 details of sample compositing are recorded on Composite Sample Preparation Record worksheets.

SAMPLE PREPARATION AND ANALYSIS

Analysis procedures were in general accordance with '**AXYS Method 905 Rev 01: *Analytical Procedure for the Analysis of Hydroxy-Polycyclic Aromatic Hydrocarbons in Urine by HRCG-HRMS.*** A method summary (MSU-905) is included in the data package following this narrative.

The samples were analyzed in batch WG51828, the composition of which is shown on the correlation table, and on the batch list heading the extraction workup sheets. The analysis batch included a procedural blank, (AXYS ID WG51889-101) prepared with synthetic urine and an Ongoing Precision and Recovery (OPRs) test sample (AXYS ID WG51889-102) prepared with spiked human urine.

An accurately measured sub-sample of approximately 4 mL sample was spiked with 30 µL of 2-mercaptoethanol to control analyte oxidation. The samples were then spiked with isotopically labeled quantification standards and β-glucuronidase enzyme. The mixture was incubated at 37°C for 17 hrs. The de-conjugated analytes were then extracted with pentane. The extracts were reduced under a gentle stream of nitrogen, spiked with the derivatization monitoring standard and the recovery standard and derivatized for 30 min with MSTFA at 60°C. The final extract volume was 225 µL, 2 µL was injected onto the HRGC/HRMS.

CALCULATIONS

Target concentrations were determined by isotope dilution or internal standard quantification procedures, using OPUSQuan software. Formulas used for conversion of the raw chromatographic data to concentrations are provided in the method summary document, MSU-905.

As described in the method summary, sample specific detection limits (SDLs) were calculated from the noise for each target analyte and used as the detection qualifier. If the OPUSquan software selected an unrepresentative region of noise for the SDL calculation, the SDL is corrected by hand on the raw data.

REPORTING CONVENTIONS

For internal tracking, ARCADIS U.S., INC., was assigned contract number 4765. AXYS logged the samples under the unique laboratory identifier of the form identifier of the form LXXXXX-XX All data reports reference both the client and lab sample identifiers.

Any extra work required and performed after the initial instrumental analysis of a sample extract is given an extra "test suffix" code. The single letter code per extra work performed is added to the AXYS sample ID as a suffix, and is combined with any other applicable test suffix codes. Test code in this data package includes:

I = Instrumental reanalysis of the sample extract
W = The sample extract was diluted and instrumentally reanalyzed
N = large dilution, new portion into fresh microvial followed by instrumental analysis
L = re-derivatization of sample extract was conducted following initial analysis

The laboratory qualifiers used are as follows:

D	=	indicates dilution data
K	=	peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration
U	=	Analyte not detected
V	=	the recovery of the surrogate falls outside the method control limits

Results are reported to three significant figures, in units of picograms per milliliter (pg/mL).

ANALYTICAL DISCUSSION

Area responses that were above the method's calibration range were observed in the following samples for 3-OH-Benzo[a]pyrene and / or 9-OH-Benzo[a]pyrene. The sample extracts were diluted to bring the area response within the calibration limit and results for these analytes were separately reported from the diluted extract analysis data.

AXYS ID	Client ID
L23368-7	401 Day 14/15
L23368-17	901 Day 14/15
L23368-18	902 Day 14/15

The derivatization control standard indicated incomplete derivatization in two sample extracts namely: 402 Day 14/15 and 602 Day 14/15 (AXYS ID L23368-8 and -12 respectively). These sample extracts were re-derivatized and the re-derivatized extracts were instrumentally analyzed. Derivatization went into completion as indicated by quantitative recovery of the derivatization control standard. Final results for these samples were reported from the re-derivatized extract analysis data.

To reduce interferences caused by matrix co-extractives the following sample extracts were diluted and instrumentally reanalyzed. Results are reported from the diluted extract analysis data.

AXYS ID	Client ID
L23368-8	402 Day 14/15
L23368-9	501 Day 14/15
L23368-10	502 Day 14/15
L23368-11	601 Day 14/15
L23368-12	602 Day 14/15
L23368-13	701 Day 14/15
L23368-14	702 Day 14/15

Due to a software limitation, data points for all the initial calibration runs could not be included on the HTML reports. As a result the mean RRF values shown on the report forms are slightly different from the mean values shown on the raw data under the Analysis Chromatographic section. For all calculations, please use average RRF values shown on the Analysis Chromatography section of the data package.

QA/QC NOTES

The QC samples were prepared alongside the client sample, and were subjected to the same analytical procedures. The sample results were evaluated in comparison to the QC samples.

- The results are not blank corrected. The sample data should be compared to the procedural blank.
- By virtue of the isotope dilution/internal standard quantification procedures, data are recovery corrected for possible losses during extraction and cleanup.
- All linearity, CAL/VER, Lab Blank, OPR and labeled compound recovery specifications were met, with the following exception:

Due to matrix co-extractives detection limits significantly above 25 pg/mL were observed in multiple samples.

Surrogate recovery for 13C6-3-OH-Chrysene was observed to be marginally below the interim method control limit value of 50% in sample 902 Day 14/15 (AXYS ID L23368-18). This has no impact on the data. The results are recovery-corrected, labeled compound recovery values are provided as general data quality indicators only.

DATA PACKAGE

This data package, assigned a unique identifier DPWG52269, includes: shown on the front page of this Data Package. Included in the data package after the narrative are the following documentations:

- Method summary, MSU-905
- Sample Correlation Table
- Sample Receiving Documentation
- Composite Sample Preparation Records
- Extraction worksheets.
- Sample data reports (Analysis Reports)
- Laboratory QC data reports
- Instrumental QC data reports (organized by analysis date)
- Sample raw data (Analysis chromatography)
- Laboratory QC raw data
- Instrumental QC raw data (organized by analysis date).

I certify that this data package complies with the terms and conditions of the contract, both technically and for completeness, except for the conditions detailed above. In addition, I certify, that to the best of my knowledge and belief, the data as reported are true and accurate. The following signature, on behalf of Axys Analytical Services Ltd, authorizes the release of the data contained in this data package.

Summary of AXYS method MLA-905 Rev. 01 Ver. 02:

ANALYTICAL PROCEDURE FOR THE ANALYSIS OF HYDROXY-POLYCYCLIC AROMATIC HYDROCARBONS IN URINE BY HRGC-HRMS

AXYS Method MLA-905 describes the determination of concentrations of selected hydroxy-polyaromatic hydrocarbons (OH-PAHs) in urine samples. According to clients' requests this analysis may be performed to determine total OH-PAHs (the sum of free OH-PAHs and conjugated OH-PAHs) and/or only free (not conjugated) OH-PAHs. Deconjugation is performed by enzymatic hydrolysis to liberate the glucuronated and sulfonated forms of the analytes into free hydroxy PAH forms.

Typical reporting limits are 10 - 25 pg /mL for each analyte using a 4 mL sample.

TARGET ANALYTES

Hydroxy polycyclic aromatic hydrocarbons (OH-PAHs)

Compound	Short name	CAS #
3-Hydroxy-chrysene	3-OH-Chrysene	63019-39-6
3-Hydroxy-benzo[a]pyrene	3-OH-Benzo[a]pyrene	13345-21-6
9-Hydroxy-benzo[a]pyrene	9-OH-Benzo[a]pyrene	17573-21-6
3-Hydroxy-benz[a]anthracene	3-OH-Benz[a]anthracene	4834-35-9
7,8-Dihydrodiol-benzo[a]pyrene (trans) *	7,8-Diol-benzo[a]pyrene, trans	60864-95-1
7,8-Dihydrodiol-benzo[a]pyrene (cis) *	7,8-Diol-benzo[a]pyrene, cis	60657-25-2

* Poorly recovered analyte, included for general information only

EXTRACTION

Urine samples are spiked with 2-mercaptoethanol to prevent oxidation of the analytes. The samples are then spiked with a suite of labeled quantification standards and labeled derivatization monitoring standard. Where total OH-PAHs (the sum of free OH-PAHs and conjugated OH-PAHs) are required β-glucuronidase enzyme is used to de-conjugate the glucuronated and sulfonated forms of the analytes into free hydroxy PAH forms. The samples are then sequentially extracted with pentane. The extracts are dried with anhydrous sodium sulphate, concentrated and derivatized to trimethylsilyl forms with N-Methyl-N-(trimethylsilyl) trifluoroacetamide.

INSTRUMENTAL ANALYSIS

Instrumental analysis is performed by high-resolution gas chromatography using a 30 m DB-17 capillary column and detection by high resolution mass spectrometry.

Analytes, Typical Retention Times, Acquired Ions and Quantification References

CALIBRATION

Initial calibration is performed using a five point calibration series of solutions that encompass the working concentration range. The derivatized initial calibration solutions contain authentic target OH-PAHs, deconjugation monitoring standards, and ^{13}C-labelled or deuterium labelled derivatization monitoring, surrogate and recovery standards. The concentrations of the authentic target compounds in the solutions vary to encompass the working range of the instrument, while the concentrations of the other compounds are constant. Calibration procedures use the mean RRFs determined from the initial calibration to calculate analyte concentrations. Calibration is verified at least once every 12 hours by analysis of a mid-level calibration solution.

Nominal Concentrations of Calibration Standard Solutions

Target analyte	CAL A CS-1	CAL B CS-2	CAL C CS-3	CAL D CS-4	CAL E CS-5	CAL F CAL VER CS-6	CAL G CS-7	CAL H CS-8
3-OH-Chrysene	0.25	0.50	1.00	5.00	50	250	500	1000

ANALYTE IDENTIFICATION

An individual chromatographic peak is identified as a target compound if the following criteria are met for the quantification and confirmation ions:

1. Peak responses must be at least three times the background noise level for the quantification mass ion.
2. Each analyte is identified with one quantification and one confirmation mass ion.
3. The relative retention time must be within the window predicted from the initial calibration runs and the surrogate standard retention times.
4. Peak maxima for quantification and confirmation ions must coincide within two seconds.

QUANTIFICATION

Target concentrations are determined by isotope dilution or internal standard quantification procedures using MassLynx software. The equation used in the conversion of the raw chromatograms to concentration is provided below:

$$\text{Sample Conc.} = \left(\frac{\text{area of Target}}{\text{area of Surro}} \times \text{weight of Surro. (ng)}\right) x \left(\frac{1}{RRF_x}\right) x \left(\frac{1}{\text{sample size (mL)}}\right),$$

where RRF_x = Relative Response Factor for the analyte. RRFs are calculated for each analyte according to the following equation:

$$RRF_x = \left(\frac{A_x}{A_{IS}}\right) \times \left(\frac{C_{IS}}{C_x}\right)$$

where: C_{IS} =The concentration of the quantification standard in the calibration standard.
C_x =The concentration of the target analyte in the calibration standard.

Final target concentrations are recovery corrected by this method of quantification.

The recovery of the surrogate standard is calculated (by internal standard quantification against the recovery standard using an average RRF) and monitored as an indication of overall data quality.

$$\text{\% Surrogate recovery} = \left(\frac{\text{area of Surrogate}}{\text{area of Recovery Std}} \times \frac{\text{Weight of Rec. Std}}{\text{Weight of Surro.}}\right) x \left(\frac{100}{RRF}\right)$$

REPORTING CRITERIA

Sample specific detection limits (SDLs) are calculated by TargetLynx software using 3 times the signal of the noise in the target channel converted to an equivalent sample concentration:

$$SDL = \left(\frac{3 \text{ x Height of Noise}}{\text{Height of Surro}} \times \text{weight of Surro (ng)}\right) x \left(\frac{1}{RRF_x}\right) x \left(\frac{1}{\text{sample size (mL)}}\right)$$

SDLs values are used as a detection qualifier. Final concentrations may be reported as picograms per milliliter (pg/mL) or picograms per gram (pg/g). The units to be used for a given project have to be negotiated at the start of every project.

QUALITY ASSURANCE/QUALITY CONTROL

All samples are analyzed in batches with the following composition:

- Batch Size – Each batch consists of test samples and additional QC samples.
- Blanks – Blanks are analyzed with a minimum frequency of 5% of client samples (i.e. each batch of up to 20 client samples contains a procedural blank). A laboratory prepared pooled urine verified for use, e.g., reference urine SC6235 or synthetic urine, is used as the matrix for the laboratory blank. The laboratory blank is also spiked with the de-conjugation monitoring standard.
- Duplicates – Where sufficient sample is available a duplicate sample is normally analyzed with each analysis batch containing greater than six (6) test samples, or as required by contract.
- OPR (Ongoing Precision and Recovery) – OPRs are analyzed with a minimum frequency of 5% of client samples (i.e. each batch of up to 20 client samples contains an OPR.) An aliquot of native standard (typically 10 µL equivalent to 20 ng per analyte) is added to 4 mL of an approved reference urine matrix to prepare the spiked reference sample. The OPR is also spiked with the de-conjugation monitoring standard.
- A Matrix Spike/Matrix Spike Duplicate may be analyzed upon client request.
- Surrogate/Authentic/Recovery (SAR) solution – Standards for OH-PAHs degrade fairly rapidly. As a diagnostic tool of standards stability control SAR must be prepared with each analysis batch and evaluated.

The batch composition may vary according to batch or quality control requirements specified by a client. Each batch is carried through the complete analytical process as a unit. For sample data to be reportable the batch QC data must meet the acceptance criteria.

QC Specification Table: Procedural Blank Levels and OPR Recoveries

Analyte	Procedural Blank Level pg/sample [1]	Acceptable OPR (% Recovery) [2]
3-OH-Chrysene	100	70-130
3-OH-Benzo[a]pyrene	100	70-130
9-OH-Benzo[a]pyrene	100	60-140
3-OH-Benz[a]anthracene	100	70-130
7,8-Diol-benzo[a]pyrene, Cis *	100	N/A
7,8-Diol-benzo[a]pyrene, Trans *	100	N/A
De-conjugation monitoring standards

1-OH-Pyrene	100	50-150
Surrogate standards		
$^{13}C_6$-3-OH-Chrysene	50-150	50-150
$^{13}C_6$-1-OH-Benz[a]anthracene	50-150	50-150
d_{11}-3-OH-Benzo[a]pyrene	20-120	20-120
$^{13}C_6$-1-OH-Naphthalene	20-120	20-120
$^{13}C_6$-1-OH-Pyrene	20-120	20-120
Derivatization monitoring standard		
$^{13}C_{12}$-4'-OH-3,3',4,5'-TetraCB	60-140	60-140
Recovery standard		
$^{13}C_{12}$-PCB-81	50-200	50-200

* Unstable analyte, included for general information only.

[1] Interim laboratory background level acceptance limit is 25 pg/mL for a 4 mL sample (i.e.,100 pg abs.)

[2] Method recovery acceptance limits are not fully developed; the values provided are interim acceptance criteria. Results outside of the values shown may be accepted based on professional judgement.

QC Specification Table: Other parameters

QC Parameter	Specification
Instrument Sensitivity	Daily, S:N ≥ 3:1 for all analytes in the lowest standard used for calibration.
Initial Calibration	Run initially, and as required to maintain calibration verification and instrument sensitivity. Average response factors are used for quantification. RSD must be less than 25% for the native compounds and less than 35% for the labelled compounds.
Continuing Calibration Verification	Run every 12 hrs, quantify against I-CAL. Calculated conc. must be 70-130% of actual. Surrogate recoveries must fall within the limits of the table above.
Instrumental Carryover	Every Initial Calibration, Cal/Ver, or OPR: < 0.3 % carryover into following toluene blank injection.
Duplicate Samples or MS/MSD	If conc. > 5 times R.L., RPD < 40% If conc. < 5 times R.L., difference between pairs < R.L.

(1)

I have shipped samples collected from Day 2 through Day 15 (10 urine sample boxes) per Ricerca protocol 031705 (Arcadis, U.S., Inc.) overnight on dry ice.

Please draw your attention to the attached memo clarifying an error in collection interval days noted on the sample collection tubes.

Please use the attached Sample Transfer records to note receipt of the samples. Also, please let me know if the shipment was received in acceptable condition. **For our records, a copy of the *completed* Sample Transfer record(s) must be sent or emailed to my attention as soon as possible.**

Thank you in advance for your time. If you have any questions, please feel free to contact Dr. Roger Hawks or myself.

Best Regards,

5.26.15

RE: Interval of collection noted on sample storage tube

It was noted following the Day 5 sample collection that the technician collecting samples had inadvertently collected the Day 4 through the Day 7 samples into the incorrect "Day Interval" labeled storage tubes. Documentation was made on the Sample Transfer record to note the discrepancies and the Study Director was notified. Since the incorrect interval tubes were used for Day 4 though Day 7, the remaining intervals for Day 12 through Day 15, were collected and stored in the remaining unused storage tubes which then had the incorrect interval noted.

Please refer to the below chart noting the tube label discrepancies.

We apologize for the error and for the inconvenience on the receiving end.

Actual Interval of collection	Storage tube labeled
Day 4	Day 14
Day 5	Day 12
Day 6	Day 15
Day 7	Day 13
Day 12	Day 4
Day 13	Day 6
Day 14	Day 7
Day 15	Day 5

RE: Date on sample labels

Note: due to the study start delay, all pre-labeled sample tubes will have an incorrect collection date noted. The correct date will be 18 days post the label date.

Example: Day 2 label notes 4-25-15 collection date, actual collection date is 5-13-15

Comments:

Sample size - 4g. Please document sample sizes in weight only.

Sample vials are presently being stored in the -80°C. They should be brought into the WIC the day before extraction to ensure that they do not stay too long at temps above 0 °C.

• Conduct all aspects of the sample preparation at low light and minimize exposure of the samples and extracts to light.

The old enzyme is fine; no need to use the fresh batch but either is fine

The new deconjugation standard, MP035A-STK/01, is better and should be used instead of old one.

| 40UL MP035A-STK/ must be added to BLK as well as to the SPM

Calibration: | MP004-CAL/

This test is not NELAP accredited. Sample results relate only to the sample tested.

COMPOUND	CAS NO.	LAB FLAG [1]	CONC. FOUND	REPORTING LIMIT (RL)[2]	ION ABUND. RATIO	RRT
3-OH-Chrysene	63019-39-6	U		1650 (S)		
3-OH-Benzo[a]pyrene	13345-21-6		154	133 (S)	5.64	1.003
9-OH-Benzo[a]pyrene	17573-21-6	K	411	89.1 (S)	1.97	1.155
3-OH-Benz[a]anthracene	4834-35-9	U		1120 (S)		

(1) Where applicable, custom lab flags have been used on this report; U = not detected at RL; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = contract defined limit.

These data are validated and reported as accurate and in accord with AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

ANAB	ANSI-ASQ National Accreditation Board, certificate AT-1861, (ISO/IEC 17025:2005 Standard)

APPENDIX I

Main Study Charles River Laboratories Dermal Penetration Study Report

FINAL REPORT

Test Facility Study No. 797160, Report No. 36843

The *In Vitro* Percutaneous Absorption of Polycyclic Aromatic Hydrocarbons Benz(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Chrysene and Dibenz(a,h)anthracene in Soil Samples Through Human Split-Thickness Skin

TEST FACILITY:
Charles River Laboratories Edinburgh Ltd.
Elphinstone Research Centre
Tranent, East Lothian
EH33 2NE

SPONSOR:
Arcadis U.S., Inc.
630 Plaza Drive, Suite 100
Highlands Ranch
CO 80129
USA

1 COMPLIANCE STATEMENT

Study Title: The *In Vitro* Percutaneous Absorption of Polycyclic Aromatic Hydrocarbons Benz(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Chrysene and Dibenz(a,h)anthracene in Soil Samples Through Human Split-Thickness Skin

GLP regulations are not applicable to studies of this nature therefore no claim of GLP compliance is made. Nevertheless, as Study Director, I confirm that this study was conducted in a GLP compliant facility and that the practices and procedures adopted during its conduct were consistent with the OECD Principles of Good Laboratory Practice as incorporated into the United Kingdom Statutory Instrument for GLP.

The study was conducted according to the procedures herein described and this report represents a true and accurate record of the results obtained.

4 INTRODUCTION

The chemicals of concern in the test items for this study were high-molecular weight Polycyclic Aromatic Hydrocarbons (PAHs) including Benz(a)anthracene (B(a)A), Benzo(a)pyrene (B(a)P), Benzo(b)fluoranthene (B(b)F), Benzo(k)fluoranthene (B(k)F), Chrysene and Dibenz(a,h)anthracene (DB(a,h)A). The PAHs are found in the clay targets used at trap and skeet ranges, which are ceramic discs composed of coal tar pitch and limestone. Fragments of these clay targets are found in the soil in the vicinity of the firing positions at these trap and skeet range sites. The test items for this study were soil samples with clay target fragments that have been sieved to 250 micron and homogenized. Documentation of concentrations of PAHs in the test items has been provided by the Sponsor.

As part of the baseline risk assessment of PAHs in the soil at these ranges, this study was conducted to assess the rate and extent of absorption of 6 PAHs, following topical application to human skin. In addition, one spiked soil sample (control soil spiked with Benzo(a)pyrene) and one sample of pulverised clay target were tested. A solution of Benzo(a)pyrene in corn oil (*ca* 1 mg/mL) and a solution of [^{14}C]-Testosterone in ethanol:water (1:1, v/v) (*ca* 4 mg/mL) were also tested.

The analytical procedure for the six PAHs was based on HPLC-FLD methodology developed under Charles River Study No. 322810. A seventh PAH, Indeno(1,2,3-cd)pyrene, was also evaluated under the development study. However, analytical limitations eliminated its evaluation in this dermal penetration study. Indeno(1,2,3-cd)pyrene is not a driver for the site and its elimination from the dermal penetration study does not adversely affect the interpretation of the study results.

5 MATERIALS AND METHODS

5.1 Test and Control Items

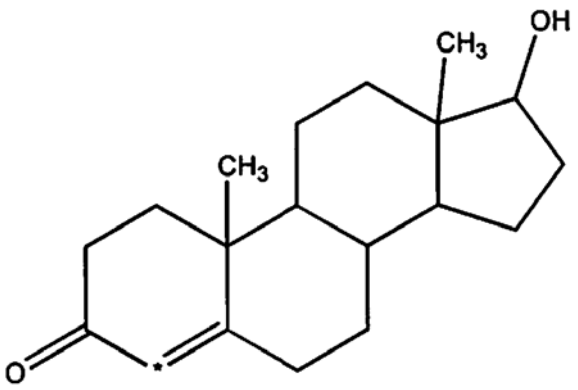
5.1.1 Test Items

The following test items were supplied by Ricerca and were stored in a refrigerator set to maintain a temperature of 4°C when not in use.

Name	Description	Batch
FAFB-G1	Foster Air Force Base Soil Contaminated with PAHs	HS15040099
FAFB-G2	Foster Air Force Base Soil Contaminated with PAHs	HS15040097
FAFB-G3	Foster Air Force Base Soil Contaminated with PAHs	HS15040080
FAFB-Clean Spiked with Benzo(a)pyrene	Clean control soil spiked with benzo(a)pyrene	HS15040080-17

The following test item was supplied by ALS Environmental and was stored at ambient temperature when not in use.

Name	Description	Batch
Target Fragments (G2)-60 Mesh	Pulverised Clay Target Fragments	94160



5.1.2 Control Items

5.1.2.1 Radiolabelled Testosterone

Carbon-14 labelled Testosterone was obtained from Quotient Bioresearch (Radiochemicals) Limited and was stored in a freezer set to maintain a temperature at -20°C in the dark when not in use. The radiochemical was supplied as a clear and colourless solution in ethanol and was accompanied by a Product Specification Sheet which included the following information:

Name:	[^{14}C]-Testosterone
Batch No:	CFQ41371
Specific Activity:	57 mCi/mmol (196.4 µCi/mg)

The structure and site of labelling (*) of [^{14}C]-Testosterone are shown below.

The chemical authenticity of the radiolabelled test item was confirmed by co-chromatography with authentic non-radiolabelled test item. The radiochemical purity of the [^{14}C]-Testosterone was determined to be 100%.

5.1.2.2 Benzo(a)pyrene

Benzo(a)pyrene (Batch No. LC09534V, expiry date September 2017) was supplied by Sigma-Aldrich and was stored at ambient temperature when not in use.

5.2 Human Skin Samples

Five samples of full-thickness human skin (three abdominal and two breast) were obtained from male and female patients aged 23 to 65 years old. The skin samples were obtained from NHS Lothian, St. John's Hospital, Livingston, UK. On arrival at Charles River, the samples were cleaned of subcutaneous fat and connective tissue using a scalpel blade. The skin samples were washed under cold running water and dried using tissue paper. The skin samples were then cut into smaller pieces, wrapped in aluminium foil or vacuum packed, placed in self sealing plastic bags and stored in a freezer set to maintain a temperature of -20°C until use. The sample details are shown in Appendix 2.

5.3 Preparation of Split-Thickness Skin

Human skin samples were removed from storage (-20°C), allowed to thaw at ambient temperature and cut to a 200-400 µm depth using a Zimmer® electric dermatome. The split-thickness membranes were stored in a freezer set to maintain a temperature of -20°C for maximum period of 2 months prior to use. The thickness of the full-thickness and split-thickness skin membranes is provided in Appendix 3.

5.4 Static Diffusion Cell Apparatus

A static diffusion cell system (PermeGear Inc) was used. The static diffusion cells were placed in a manifold on a magnetic stirrer plate heated *via* a circulating water bath to maintain the skin surface temperature at 32°C ± 1°C. The water baths were calibrated prior to use and the temperature for each cell was recorded (31.3°C to 32.8°C).

The surface area of the exposed skin within the cells was 3.14 cm^2. The receptor chamber volume was nominally 10 mL, with each receptor chamber individually marked with the actual volume by the manufacturer.

5.5 Receptor Fluid

Phosphate buffered saline containing polyoxyethylene 20 oleyl ether (PEG, *ca* 6%, w/v), sodium azide (*ca* 0.01%, w/v), streptomycin (0.1 mg/mL) and penicillin (100 units/mL) was chosen as the receptor fluid for this study. The pH was confirmed and adjusted to pH 7.4 +/- 0.1, if required. The receptor fluid was degassed by sonication and stored in a fridge set to maintain a temperature of 4°C until use.

5.6 Solubility of Test Items in Receptor Fluid

The solubility of the test items in the receptor fluid was not confirmed.

5.7 Barrier Integrity Assessment

The electrical resistance was measured using a Tinsley Databridge (Model 6401) set at low voltage alternating current, 1000 Hz with a maximum voltage of 300 mV root-mean-squared (rms) in the parallel equivalent circuit mode. Any skin sample exhibiting a resistance less than 4 kΩ was excluded from subsequent absorption measurements. A cross reference of skin cell number, donor number and electrical resistance (kΩ) is presented in Appendix 4.

5.8 Pre-Dose Receptor Fluid Collection

Prior to dosing, a 300 µL sample of receptor fluid was removed from the receptor chamber collection arm using a positive displacement pipette. The receptor fluid volume was then maintained by the addition of fresh receptor fluid up to the calibration line on the receptor chamber collection arm. Methanol:scintillation fluid (12 mL)was added to the samples for Cells 31-35.

5.9 Test Preparations

5.9.1 Test Preparation 1

Soil Sample FAFB-G1.

5.9.2 Test Preparation 2

Soil Sample FAFB-G2.

5.9.3 Test Preparation 3

Soil Sample FAFB-G3.

5.9.4 Test Preparation 4

Target Fragments (G2)-60 Mesh.

5.9.5 Test Preparation 5

Benzo(a)pyrene spiked soil.

5.9.6 Test Preparation 6

Benzo(a)pyrene was dissolved in corn oil at a final concentration of *ca* 1 mg/mL.

5.9.7 Test Preparation 7

[^{14}C]-Testosterone was incorporated into ethanol:water (1:1%, v/v) at a final concentration of *ca* 4 mg/mL.

5.10 Application of Test Preparation

5.10.1 Test Preparations 1-5

A single *ca* 31.4 mg dose of Test Preparation 1 (*ca* 10 mg/cm^2) was applied to 5 samples of human skin obtained from five different donors. After application, artificial sweat (physiological saline) was applied to the skin at the same application rate (10 mg/cm^2). The pipette tip was used to gently mix the soil and saline on the skin surface. The donor chamber of the cells was not be occluded and so was left open to the atmosphere. Test Preparations 2-5 were applied using the same procedure.

5.10.2 Test Preparations 6 and 7

A single 31.4 µL dose of Test Preparation 6 (10 µL/cm^2) was applied to 5 samples of human skin obtained from five different donors. The test preparation was applied to the stratum corneum surface of the skin using a positive displacement pipette. The donor chamber of the cells was not occluded and so was left open to the atmosphere. Test Preparation 7 was applied using the same procedure.

5.11 Justification for Dosing Regimen

The application rates (*ca* 10 mg/cm^2 or 10 µL cm^2) were agreed with the Sponsor prior to study commencement.

5.12 Receptor Fluid Sampling

The receptor fluid was stirred continuously over the 72 h monitoring period. Receptor fluid aliquots were collected at 1, 2, 4, 8, 16, 24, 36, 48, 60 and 72 h post dose as described in Section 5.8. The receptor fluid volume was not maintained after the 72 h collection. All receptor fluid samples were stored in a freezer set to maintain a temperature of -20°C prior to analysis. Methanol:scintillation fluid (12 mL)was added to the samples for Cells 31-35.

5.13 Terminal Exposure – 24 h Post Dose

At 24 h post dose, the exposure period was terminated by applying ultra-pure water in aliquots (5 mL total volume) to the skin surface. Each aliquot (1 mL) was aspirated on the skin surface. The skin surface and cells were dried with tissue paper swabs after washing. This process was then repeated. For the solid test preparations mixed with saline (Test

Preparations 1-5), additional tissue swabs were employed prior to washing to assist with removal. The water washings (skin wash) and tissue swabs were retained against future interest.

5.14 Terminal Post Exposure Monitoring – 72 h Post Dose

At 72 h post dose, the cells were dismantled. The receptor chamber was emptied and rinsed with methanol (*ca* 40 mL). The skin was dried with tissue swabs. The stratum corneum was partially removed using 5 successive tape strips (D-Squame® tapes). If any epidermis was inadvertently removed during tape stripping this was recorded (see Appendix 5). Tapes were pooled as a single sample for analysis. The skin under the cell flange (unexposed skin) was cut off from the exposed skin and the exposed skin retained for analysis. Methanol (10 mL) was added to each exposed skin and tape strip sample to extract the test item prior to analysis. The donor chamber wash, tissue swabs and unexposed skin were retained against future interest.

5.15 Analytical Method

5.15.1 Test Preparations 1-6

The analytical procedure was based on HPLC-FLD methodology developed under Charles River Study No. 322810. Assay linearity, intra-batch assay accuracy and precision, assay selectivity, recovery from skin and tape strips and re-injection stability were all confirmed prior to analysis of the absorption experiment samples.

5.15.2 Test Preparation 7

All samples were counted together with representative blanks using a liquid scintillation analyser (Packard 2100-TR) with automatic quench correction by external standard. Representative blank sample values were subtracted from sample count rates to give net d.p.m. per sample. Prior to analysis, samples were allowed to stabilise with regard to light and temperature.

5.16 Electronic Data Acquisitions and Systems

The data was transferred into Microsoft® Office Excel® 2007 for calculation of result tables and graphs.

Chromatography data were acquired using Atlas 2002 version 6.18 (Thermo Electron Corporation, St George's Court, Hanover Business Park, Altrincham, Cheshire, WA14 5TP, United Kingdom).

5.17 Data Presentation

Data presented in results, tables, figures and appendices are computer generated and rounded appropriately for inclusion in the report. As a consequence, calculation of values from data presented will, in some instances, yield minor variations.

5.18 Lower Limit of Quantification (LLOQ)

The LLOQ values for each analyte were as follows:

Test Item	LLOQ (ng/mL)
B(a)A	0.1
B(a)P	0.1
B(b)F	0.5
B(k)F	0.1
Chrysene	0.5
DB(a,h)A	0.1

Where sample analysis yielded a value <LLOQ, the LLOQ has been used for any subsequent calculations. Entry of the LLOQ values resulted in the following minimum absorption and distribution values:

	Minimum Value (ng/cm^2) Based on All Data <LLOQ					
	B(a)A	B(a)P	B(b)F	B(k)F	Chrysene	DB(a,h)A
Absorbed Dose	0.40	0.40	2.02	0.40	2.02	0.40
Tape Strips 1-5	0.32	0.32	1.59	0.32	1.59	0.32
Exposed Skin	0.32	0.32	1.59	0.32	1.59	0.32
Dermal Delivery	0.72	0.72	3.61	0.72	3.61	0.72

Receptor fluid values are based on a cell receptor chamber volume of exactly 10 mL (individual receptor chamber volumes may be slightly higher or lower than 10 mL).

5.19 Definitions

The definitions used are taken directly from the OECD Guidance Document No. 28. For the definitions see Appendix 6.

5.20 Protocol Deviations

The study was performed in accordance with the protocol for Charles River Study No. 797160.

6 RESULTS AND DISCUSSION

A summary of the absorbed dose, tape strip 1-5, exposed skin and dermal delivery results are shown in Table 1 to Table 4, respectively.

6.1 Soil Sample FAFB-G1 Applied to Human Skin

Soil Sample FAFB-G1 was applied to a total of five samples of human skin obtained from five different donors that had previously passed the electrical resistance barrier integrity assessment. The individual absorption profiles and the mean absorption profiles for each analyte are shown in Figure 1 to Figure 12. The distribution data is provided in Table 5. The receptor fluid data are shown in Table 6 to Table 12. The tape strip 1-5 data are shown in Table 13. The exposed skin data are shown in Table 14.

6.2 Soil Sample FAFB-G2 Applied to Human Skin

Soil Sample FAFB-G2 was applied to a total of five samples of human skin obtained from five different donors that had previously passed the electrical resistance barrier integrity assessment. The individual absorption profiles and the mean absorption profiles for each analyte are shown in Figure 13 to Figure 24. The distribution data is provided in Table 15. The receptor fluid data are shown in Table 16 to Table 22. The tape strip 1-5 data are shown in Table 23. The exposed skin data are shown in Table 24.

6.3 Soil Sample FAFB-G3 Applied to Human Skin

Soil Sample FAFB-G3 was applied to a total of five samples of human skin obtained from five different donors that had previously passed the electrical resistance barrier integrity assessment. The individual absorption profiles and the mean absorption profiles for each analyte are shown in Figure 25 to Figure 36. The distribution data is provided in Table 25. The receptor fluid data are shown in Table 26 to Table 32. The tape strip 1-5 data are shown in Table 33. The exposed skin data are shown in Table 34.

6.4 Target Fragments (G2)-60 Mesh Applied to Human Skin

Target Fragments (G2)-60 Mesh was applied to a total of five samples of human skin obtained from five different donors that had previously passed the electrical resistance barrier integrity assessment. The individual absorption profiles and the mean absorption profiles for each analyte are shown in Figure 37 to Figure 48. The distribution data is provided in Table 35. The receptor fluid data are shown in Table 36 to Table 42. The tape strip 1-5 data are shown in Table 43. The exposed skin data are shown in Table 44.

6.5 FAFB-Clean Spiked with Benzo(a)pyrene Applied to Human Skin

FAFB-Clean Spiked with Benzo(a)pyrene was applied to a total of five samples of human skin obtained from five different donors that had previously passed the electrical resistance barrier integrity assessment. The individual absorption profiles and the mean absorption profiles for each analyte are shown in Figure 49 - Figure 60. The distribution data is provided in Table 45. The receptor fluid data are shown in Table 46 to Table 52. The tape strip 1-5 data are shown in Table 53. The exposed skin data are shown in Table 54.

6.6 Benzo(a)pyrene in Corn Oil (*ca* 1mg/mL) Applied to Human Skin

Benzo(a)pyrene in Corn Oil (*ca* 1 mg/mL) was applied to a total of five samples of human skin obtained from five different donors that had previously passed the electrical resistance barrier integrity assessment. The individual absorption profiles and the mean absorption profile are shown in Figure 61 and Figure 62. The distribution data is provided in Table 55. The receptor fluid data are shown in Table 56 - Table 57. The tape strip 1-5 data are shown in Table 58. The exposed skin data are shown in Table 59.

6.7 [^{14}C]-Testosterone in Ethanol:water (1:1%, v/v) (*ca* 4 mg/mL) Applied to Human Skin

[^{14}C]-Testosterone in ethanol:water (1:1%, v/v) (*ca* 4 mg/mL) was applied to a total of five samples of human skin obtained from five different donors that had previously passed the electrical resistance barrier integrity assessment. The individual [^{14}C]-Testosterone absorption profiles are shown in Figure 63. The mean [^{14}C]-Testosterone absorption profile is shown in Figure 64. The distribution data are shown in Table 60. The receptor fluid data are shown in Table 61 and Table 62.

7 CONCLUSION

In conclusion, following application of Soil Sample FAFB-G1 to human skin, the absorbed dose and dermal delivery of benz(a)anthracene were 0.82 ng/cm^2 and 1.14 ng/cm^2, respectively. The absorbed dose and dermal delivery of benzo(a)pyrene were 1.09 ng/cm^2 and 1.43 ng/cm^2, respectively. The absorbed dose and dermal delivery of benzo(b)fluoranthene were 2.74 ng/cm^2 and 4.32 ng/cm^2, respectively. The absorbed dose and dermal delivery of benzo(k)fluoranthene were 0.69 ng/cm^2 and 1.00 ng/cm^2, respectively. The absorbed dose and dermal delivery of chrysene were 2.03 ng/cm^2 and 3.61 ng/cm^2, respectively. The absorbed dose and dermal delivery of dibenz(a,h)anthracene were 0.41 ng/cm^2 and 0.72 ng/cm^2, respectively.

Following application of Soil Sample FAFB-G2 to human skin, he absorbed dose and dermal delivery of benz(a)anthracene were 11.81 ng/cm^2 and 17.24 ng/cm^2, respectively. The absorbed dose and dermal delivery of benzo(a)pyrene were 11.41 ng/cm^2 and 22.32 ng/cm^2, respectively. The absorbed dose and dermal delivery of benzo(b)fluoranthene were 17.79 ng/cm^2 and 33.35 ng/cm^2, respectively. The absorbed dose and dermal delivery of benzo(k)fluoranthene were 4.59 ng/cm^2 and 9.82 ng/cm^2, respectively. The absorbed dose and dermal delivery of chrysene were 2.36 ng/cm^2 and 3.94 ng/cm^2, respectively. The absorbed dose and dermal delivery of dibenz(a,h)anthracene were 0.41 ng/cm^2 and 0.72 ng/cm^2, respectively.

Following application of Soil Sample FAFB-G3 to human skin, the absorbed dose and dermal delivery of benz(a)anthracene were 2.38 ng/cm^2 and 3.35 ng/cm^2, respectively. The absorbed dose and dermal delivery of benzo(a)pyrene were 2.60 ng/cm^2 and 4.34 ng/cm^2, respectively. The absorbed dose and dermal delivery of benzo(b)fluoranthene were 4.53 ng/cm^2 and 7.56 ng/cm^2, respectively. The absorbed dose and dermal delivery of benzo(k)fluoranthene were 1.01 ng/cm^2 and 1.91 ng/cm^2, respectively. The absorbed dose and dermal delivery of chrysene were 2.07 ng/cm^2 and 3.66 ng/cm^2, respectively. The absorbed dose and dermal delivery of dibenz(a,h)anthracene were 0.41 ng/cm^2 and 0.73 ng/cm^2, respectively.

Following application of Target Fragments (G2)-60 Mesh to human skin, the absorbed dose and dermal delivery of benz(a)anthracene were 120.47 ng/cm^2 and 308.81 ng/cm^2, respectively. The absorbed dose and dermal delivery of benzo(a)pyrene were 76.26 ng/cm^2 and 367.98 ng/cm^2, respectively. The absorbed dose and dermal delivery of benzo(b)fluoranthene were 111.91 ng/cm^2 and 516.43 ng/cm^2, respectively. The absorbed dose and dermal delivery of benzo(k)fluoranthene were 34.08 ng/cm^2 and 171.22 ng/cm^2, respectively. The absorbed dose and dermal delivery of chrysene were 5.35 ng/cm^2 and 6.94 ng/cm^2, respectively. The absorbed dose and dermal delivery of dibenz(a,h)anthracene were 0.40 ng/cm^2 and 0.72 ng/cm^2, respectively.

Following application of FAFB-Clean Spiked with Benzo(a)pyrene to human skin, the absorbed dose and dermal delivery of benz(a)anthracene were 0.42 ng/cm^2 and 6.12 ng/cm^2, respectively. The absorbed dose and dermal delivery of benzo(a)pyrene were 8.35 ng/cm^2 and 21.39 ng/cm^2, respectively. The absorbed dose and dermal delivery of benzo(b)fluoranthene were 2.02 ng/cm^2 and 12.84 ng/cm^2, respectively. The absorbed dose and dermal delivery of benzo(k)fluoranthene were 0.40 ng/cm^2 and 3.67 ng/cm^2, respectively. The absorbed dose and dermal delivery of chrysene were 2.02 ng/cm^2 and 3.61 ng/cm^2, respectively. The absorbed dose and dermal delivery of dibenz(a,h)anthracene were 0.40 ng/cm^2 and 0.72 ng/cm^2, respectively.

Following application of Benzo(a)pyrene in Corn Oil (*ca* 1 mg/mL), the absorbed dose and dermal delivery of benz(a)anthracene were 0.41 ng/cm^2 and 1.60 ng/cm^2, respectively. The absorbed dose and dermal delivery of benzo(a)pyrene were 51.00 ng/cm^2 and 192.22 ng/cm^2, respectively. The absorbed dose and dermal delivery of benzo(b)fluoranthene were 2.03 ng/cm^2 and 4.68 ng/cm^2, respectively. The absorbed dose and dermal delivery of benzo(k)fluoranthene were 0.41 ng/cm^2 and 1.08 ng/cm^2, respectively. The absorbed dose and dermal delivery of chrysene were 2.03 ng/cm^2 and 3.61 ng/cm^2, respectively. The absorbed dose and dermal delivery of dibenz(a,h)anthracene were 0.41 ng/cm^2 and 0.72 ng/cm^2, respectively.

Following application of [^{14}C]-Testosterone in ethanol:water (1:1%, v/v) (*ca* 4 mg/mL), the absorbed dose and dermal delivery of [^{14}C]-Testosterone were 0.89 µg equiv./cm^2 and 2.77 µg equiv/cm^2, respectively.

8 DISCUSSION

The controls (Test Preparation 6 and Test Preparation 7) confirmed the efficiency of the experiment and analytical method. The results for Test Preparation 6 also demonstrate that benzo(a)pyrene can be detected by the test system and analytical method.

The measured absorbed dose value (0.89 µg equiv./cm^2) and dermal delivery value (2.77 µg equiv./cm^2) for [^{14}C]-Testosterone are similar to those achieved on Charles River Study No. 993072 (1.53 µg equiv./cm^2 and 3.32 µg equiv./cm^2, respectively).

Entries in bold italics are <LLOQ. The LLOQ value has been entered to represent a worst case value.
Mean and SD values in bold italics have been calculated from data that contain 1 or more individual results <LLOQ.
For Cell 16, the mean value of the 24 h and 48 h receptor fluid values was entered for 36 h time point, as there was no sample left to allow the reanalysis.

Table 42 Mean Absorption rates (ng/cm^2/h) of Benz(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Chrysene and Dibenz(a,h)anthracene in Receptor Fluid Following Topical Application of Target Fragments (G2)-Mesh Test Preparation 4 to Human Split-Thickness Membranes

31	0623	6.626
32	0670	5.382
33	0676	6.306
34	0664	5.508
35	0674	5.068

Rejection criterion, sample rejected if electrical resistance < 4 kΩ for split-thickness skin.

Appendix 5 Epidermis Removal by Tape Stripping

The stratum corneum was removed with five successive tape strips. Where epidermis was removed this is reported in the table below.

Cell Number	Tape Strip Number (Fraction of Epidermis Removed)
2	5 (trace)
30	5 (1/3)

Appendix 6 OECD Guidance Document No. 28 Glossary of Terms

GLOSSARY OF TERMS

Absorbed dose (*in vivo*): comprises that present in urine, cage wash, faeces, expired air (if measured), blood, tissues (if collected) and the remaining carcass, following removal of application site skin.

Absorbed dose (*in vitro*): mass of test substance reaching the receptor fluid or systemic circulation within a specified period of time.

Absorbable dose (*in vitro and in vivo*) represents that present on or in the skin following washing.

Absorption (Dermal, Percutaneous and Skin absorption): diffusion of chemicals from the outer surface of the skin to the receptor fluid or systemic circulation.

Absorption profile: a graphical representation of cumulative absorption as a function of time.

Absorption rate: mass of test substance passing through a unit area of skin into the receptor fluid or systemic circulation, per unit time (in $\mu g/cm^2/h$).

Adsorption: reversible binding or adherence the test substance to any component of the test system.

Applied dose: mass of test preparation containing a specified mass of test substance applied per cm^2 of skin.

Dermal delivery: sum of the applied dose found in the treated skin and the absorbed dose at the end of the experiment.

Dislodgeable dose: mass of test substance that is removable from the application site.

Exposure period: time from application of test preparation to removal at skin washing.

Finite dose: amount of test preparation applied to the skin where a maximum absorption rate of the test substance may be achieved for a certain time interval but is not maintained.

Flux: mass of test substance passing through a unit area of skin per unit of time under steady-state conditions (in $\mu g/cm^2/h$).

'in-use' preparation: the preparation of test substance which relates directly to potential human exposure (e.g. cosmetic or agrochemical formulations and dilutions thereof, a mixture of industrial chemicals in a solvent, etc.).

Infinite dose: amount of test preparation applied to the skin where a maximum absorption rate of the test substance is achieved and maintained.

Lag time: derived from a graph of cumulative absorbed dose and time. Intercept of the tangent of the linear part of the absorption profile with the x-axis.

Penetration enhancer: adjuvant, which facilitates penetration of the test substance through skin.

Appendix 6
(Continued)

Percentage absorption: the mass of test substance absorbed (over a given time period) divided by the mass of test substance applied multiplied by 100.

Permeability coefficient (Kp): a value, in units of cm/h, that represents the rate at which a chemical penetrates the skin. This is calculated from the flux divided by the applied concentration.

Steady-state: the part of an absorption profile where the absorption rate remains constant.

Test substance: a single chemical entity whose penetration characteristics are under investigation.

Test preparation: actual material that is applied to the skin. Usually the test preparation will be the 'in-use' preparation that reflects actual use conditions; alternatively it may be a mixture of the test substance in a carrier or solvent to facilitate application to the skin.

Unabsorbed dose: represents that washed from the skin surface after exposure and any present on the non-occlusive cover, including any dose shown to volatilise from the skin during exposure.

APPENDIX J

Subject:

Determination of A Conservative Estimate for the Relative Bioavailability Factor for Benzo(a)pyrene for Use at the former Foster Air Force Base

---

This memorandum details the determination of a reasonable maximum estimate for the relative bioavailability factor (RBAF) statistic for benzo(a)pyrene (BaP) from soils collected from the former Foster Air Force Base (FAFB). The data used for the analysis include the day 7 and day 14 BaP metabolite urinary excretion rates for mice treated daily with soil amended or soil extract amended diets formulated from soil samples collected at the FAFB. Regression analyses were performed using the approach described by Casteel et al. (2001, 2003) on: 1) the combined FAFB day 7 and 14 datasets, 2) the FAFB day 7 dataset, 3) the FAFB day 14 dataset, and 4) the combined FAFB day 7 and 14 datasets excluding the high-dose group to account for potential impact of enzyme induction (if it were occurring). Additionally, a regression analysis was performed excluding the two highest doses to evaluate the extent to which the RBAF may depend on dose. These analyses provide 95% upper confidence limits (UCLs) on the RBAF for BaP that range from 9% to 21%. The 95% UCL for the RBAF determined from the full data set (i.e., day 7 and 14 combined) is 14%. RBAFs are within 20% of best-fit RBAF estimates. Included in this memorandum are regression plots showing the relationship between BaP metabolite excretion (micromoles per day [µmole/d] and dosing rates [µmole/d]) for soil amended and soil extract amended diets, statistical results from regression analyses, summary tables of key regression results, and a description of the Monte Carlo procedure used to estimate 95% UCLs on the RBAFs.

This evaluation provides the basis for use of the term “conservative” when discussing the use of a 20% RBAF in calculating revised Tier 2 Protective Concentration Levels (PCLs) and use in human health risk

assessments for the former FAFB. Additionally, the correlation coefficients and standard errors of slopes show that the effect of potential fecal contamination, use of Nalgene metabolic cages, and enzyme induction (if they were occurring) had minimal impacts on the RBAF estimate. Thus, the RBAF of 20% for BaP is a reasonable maximum estimate and is appropriate for calculating Tier 2 PCLs for use at the former FAFB.

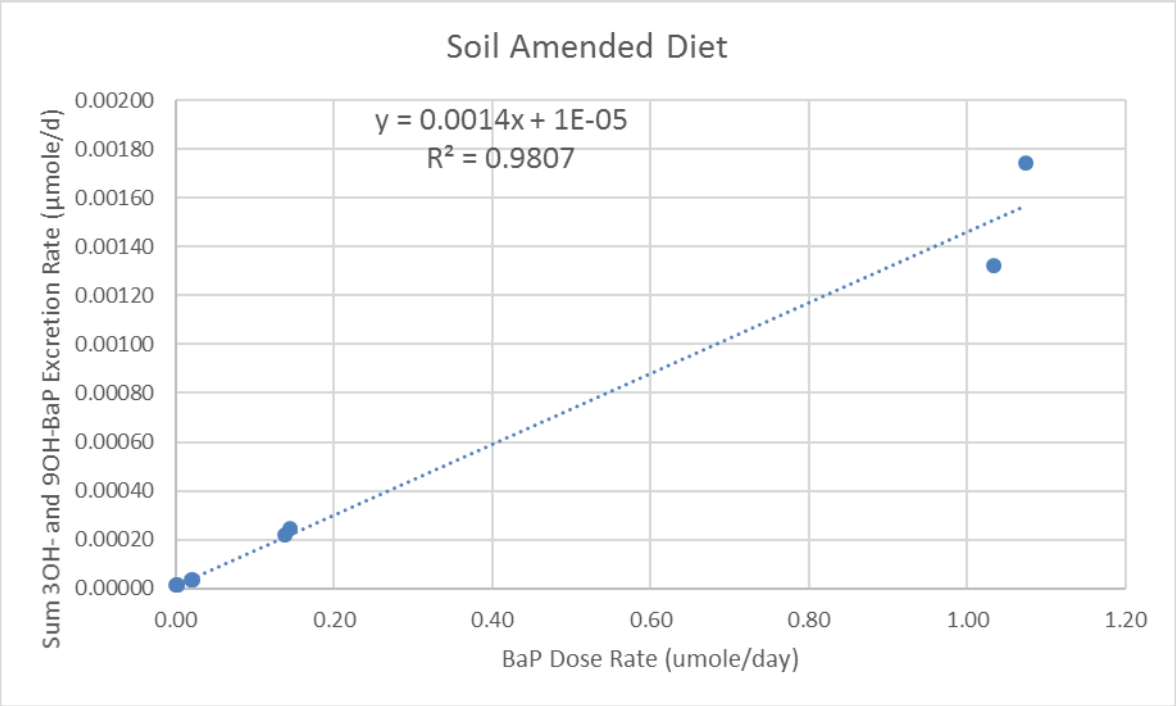
The 95% UCL on the RBAF for BaP Based on the FAFB Dataset

The following equation shows the calculation of the mean BaP RBAF based on comparison of metabolite urinary excretion rates from mice treated with diets amended with soil or soil extracts collected from the former FAFB.



$$RBAF = \frac{Slope\ from\ soil\ amended\ diet}{Slope\ from\ soil\ extract\ amended\ diet} = \frac{0.0022}{0.021} = 0.11$$

As shown above, the RBAF is calculated as the ratio of two slopes, each of which is estimated using linear regression through a set of data points from the FAFB oral bioavailability study. However, there is uncertainty in each slope estimate owing to natural variability in the data. Given the central tendency estimate and the standard error of the slope statistic for each regression, the uncertainty in the ratio may be estimated using a Monte Carlo simulation. The probability density function (PDF) describing the confidence around each slope term (UEF) was assumed to be characterized by a t-distribution with n-2 degrees of freedom. Using this approach, a Monte Carlo simulation was run for the RBAF calculation and the 97.5th percentile value from the simulated distribution of RBAF values was taken to be the upper 95 UCL for the RBAF. This procedure yielded a 95% UCL for the BaP RBAF of 0.14, or 14%.

Table 7. Comparison of PAH Fractional Urinary Excretion Rates and RBAFs for Three Dose Ranges of BaP Evaluated in the Foster Bioavailability Study

FUEs based on regressions	**FUE [95% CI]**	**r^2**
Soil Amended Diet, Day 7+14 (all doses)	0.0022 [0.0018, 0.0027]	0.83
Soil Amended Diet, Day 7+14 (high-dose excluded)	0.0019 [0.0016, 0.0021]	0.95
Soil Amended Diet, Day 7+14 (two highest doses excluded)	0.0018 [0.0011, 0.0026]	0.77
Soil-Extract Amended Diet, Day 7+14 (all doses)	0.021 [0.019, 0.022]	0.97
Soil-Extract Amended Diet, Day 7+14 (high-dose excluded)	0.010 [0.009, 0.011]	0.97
Soil-Extract Amended Diet, Day 7+14 (two highest doses excluded)	0.011 [0.0098, 0.012]	0.98
Regression evaluations	**Central-tendency RBAF (*n*)**	**Ratio of High to Low Dosages for Soil (S) and Soil-Extract (SE) Amended Diets**
Day 7+14 (all doses)	0.11 (*39*)	3,800 (S), 1,600 (SE)
Day 7+14 (high-dose excluded)	0.19 (*31*)	510 (S), 370 (SE)
Day 7+14 (two highest doses excluded)	0.17 (*23*)	79 (S), 52 (SE)

FUE = Fractional Urinary Extraction

The statistical results from regression analyses that sequentially removed the highest doses are shown in Table 7. There is no evidence that FUEs for the soil amended diets are related to dosing levels (*p*-value >0.05, analysis of variance F-test). There is evidence that FUEs for the extract amended diets differ based on dose range (*p*-value <0.001, analysis of variance F-test), but only when the highest dose group is included in the regression analysis (*p*-value <0.001 based on the Holm-Sidak method). There is no evidence that FUEs differ between extract amended diets when the highest dose group is excluded (*p*-value > 0.05, analysis of variance F-test). The RBAFs derived from regressions that do not include the highest dose group range from 0.17 to 0.19 and are 1.5 to 1.7 times higher than when the highest dose group is included in the regressions. Central-tendency estimates of RBAFs were less than 0.2 across all regression evaluations and were not dependent upon dose (i.e., they were dose-independent). The similarity between the RBAFs is notable considering that dosages ranged over three orders of magnitude. Taken together, these results support the use of 0.2 as a reasonable maximum estimate of the RBAF for BaP.
