1 INTRODUCTION

1.1 Purpose

This report documents the results of the Bioavailability Study for polycyclic aromatic hydrocarbons (PAHs) in clay target fragments from soil at the former Foster Air Force Base (FAFB) Skeet Range Site, Victoria, Texas (the Site) (Formerly Used Defense Site No. K06TX0601-05). The former Foster AFB is currently known as Victoria Regional Airport. This report summarizes activities completed as part of the Pilot Study and Main Study for evaluating the bioavailability of PAHs in soil from weathered clay target fragments by incidental ingestion and dermal exposure pathways. The goal of the investigation was to collect data for the development of site-specific relative bioavailability factors (RBAFs) for use in calculation of protective concentration levels (PCLs) for PAHs in soil under the Texas Risk Reduction Program (TRRP: 30 TAC §350.74(j)(1)(C)) and site-specific dermal absorption factors (ABS.ds) for PAHs in soil under TRRP (30 TAC §350.74(j)(1)(B)). The PAH Bioavailability Study was completed under United States Army Corps of Engineers (USACE) Contract Number W912P8-08-D-0024 (Task Order Number DY10) for the Remedial Investigation Planning per the requirements of the contract task order. A Draft Final version of this report was previously submitted to the Texas Commission on Environmental Quality (TCEQ) under USACE Contract Number W912P8-08-D-0024 (Task Order Number DY10) in March 2016. This version (Final) incorporates previous stakeholder comments and associated responses, including responses to comments (dated May 22, 2017) received from the United States Environmental Protection Agency (USEPA) Office of Superfund Remediation and Technology Innovation's (OSRTI's) Technical Review Workgroup Bioavailability Committee (TRW BAC), as well as responses to comments received from TCEQ (dated September and October 4, 2017) and observations received from the TRW BAC (September 29, 2017).

The investigation at the former FAFB was conducted in two study phases: Pilot Study and Main Study. The purpose of the Pilot Study was to collect bulk soil samples from biased locations at the Site exhibiting the highest concentrations of PAHs to test the implementability and sensitivity of the oral bioavailability protocol and refine procedures for the Main Study. The Pilot Study included development of an analytical method for the analysis of PAH metabolites in urine. The Main Study included collection of bulk samples from multiple locations at the Site, providing a range of concentrations for PAHs in soil, to evaluate potential dose/response relationships for both oral bioavailability and dermal absorption.

A bioavailability pilot study for the Former Laredo AFB site in Laredo, Texas, was also completed concurrent with these studies at the Former Foster AFB Skeet Range Site. Because the source of PAHs is the same at these two sites, testing results for both investigations were compared to support bioavailability conclusions and PCL calculations.

1.2 Background

Foster Army Airfield was initially constructed in 1941. The former airfield was used as a basic flight training center for aviation cadets during World War II (WWII). The Army deactivated the airfield in October 1945, and the facility was reactivated in 1951 by the Air Force and designated Foster AFB. The Air Force used the installation for single-engine jet training during the Korean War. The base was

transferred to Tactical Air Command in 1954 and became the headquarters for the 19th Air Force. Foster AFB operated until January 1959, when it was deactivated. The Victoria County Airport was moved to Foster AFB in 1960, and then became the Victoria Regional Airport in 1976. Victoria Regional Airport currently provides passenger air service and regional connections. The facility is shown on Figure 1.

A draft Affected Property Assessment Report (APAR) was submitted to the TCEQ for the former skeet range Site at the former Foster AFB in 2003 for regulatory closure of the Site under the TRRP. The APAR identified surface soil (0 to 1 foot below ground surface [bgs]) impacted by lead and lead shot pellets as the source of risk to human health and the environment. The APAR was not approved by the TCEQ, who requested that PAHs associated with clay target fragments be addressed in the investigation. A strategy for regulatory closure of the skeet range Site was developed in a series of three "White Papers" prepared for the USACE in 2004 and 2005. The closure strategy was implemented in a revised APAR submitted to the TCEQ in 2005. The TCEQ responded to the revised 2005 APAR with 26 comments, triggering a contract between the USACE and its contractor (the ECC company) in 2005 to implement the remedial efforts outlined in the *White Paper Strategy for Regulatory Closure* (Washington Group International 2004) to achieve closure at the former Foster AFB.

Additional investigations at the former Foster AFB Site were conducted from 2006 through 2008 to achieve the following:

- Complete remedial efforts outlined in White Paper Strategy;
- Complete lateral characterization of PAHs in surface soil (0 to 2 feet bgs);
- Assess PAHs in sieved and unsieved soil samples;
- Calculate a Tier 2 ^{GW}Soil PCL; and
- Address TCEQ comments on the Screening Level Ecological Risk Assessment (SLERA) presented in the 2005 APAR.

Based on the results of these investigations, revised APAR and SLERA documents recommending no further action were prepared in September 2009 and submitted to the TCEQ in August 2010. Comments on the 2009 APAR submittal were received from the TCEQ in November 2010. The TCEQ comments rejected the request for closure due to the presence of the seven potentially carcinogenic PAHs (including benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene) in surface soil at concentrations above Tier 1 Commercial/Industrial $^{Tot}Soil_{Comb}$ PCLs. The TCEQ has specifically rejected using the synthetic precipitation leaching procedure (SPLP) analysis to evaluate the bioavailability of PAHs in the coal tar pitch/limestone matrix of the clay target fragments.

Historically, the USACE assumed that PAHs in clay target fragments were not bioavailable based on information published by the Interstate Technology and Regulatory Council (ITRC 2003). Under TRRP, the TCEQ only allows for bioavailability adjustments using site-specific information rather than information published in literature sources. The purpose of this investigation is to collect and test soil samples from the former Foster AFB Site to generate site-specific data in support of calculating PCLs that account for the bioavailability of PAHs in the coal tar pitch/limestone matrix of the clay target fragments.

1.3 Report Organization

The PAH Bioavailability Study for the Site was completed in seven stages including:

1. Investigation Plan Development
2. Pilot Study
3. Main Study Sample Collection and Test Article Preparation
4. Main Study *In vivo* Oral Bioavailability Testing
5. Main Study Urine Analysis
6. Main Study *In Vitro* Dermal Absorption Testing
7. Calculations of RBAFs, ABS.d values, and PCLs.

This report has been organized into the following sections to align with the study:

Section 1 – Introduction

Section 2 – Pilot Study: The Pilot Study was designed to test the sensitivity of the oral bioavailability protocols; develop the analytical method for PAH metabolites in urine; and refine test article preparation, diet preparation, and data collection methodologies. Bulk soil samples were collected from locations at the Site with high densities of clay target fragments in soil to ensure high concentrations of PAHs in samples. The Pilot Study included testing soil drying and sieving techniques for preparation of soil test articles and soil extracts used in diet preparation for oral bioavailability testing. Pilot Study test articles were prepared by ALS Environmental and delivered to Ricerca Biosciences (Ricerca) for diet preparation, animal dosing, and urine collection. Urine samples were delivered to AXYS Analytical for analysis of PAH metabolites following AXYS' method development. Analytical data for PAHs in diet and PAH metabolites in urine from paired analyses of test groups exposed to PAHs in diet from soil test articles and PAHs in diet from extracts were used as the basis for calculating RBAFs. By completing the Pilot Study, all components of the investigation plan were tested, and results were used to refine the Investigation Plan for the Main Study.

Section 3 – Main Study Sample Collection, Test Article Preparation, and Bioassay: Ten bulk soil samples were collected from five locations at the Site representing a range of individual PAH concentrations from less than 0.1 part per million (ppm) to greater than 100 ppm, serving as the basis of laboratory soil test articles with a range in concentrations of more than three orders of magnitude. A two-step sieving and mixing procedure was employed to convert soil samples into the test articles for dosing based on Pilot Study results. The initial sieving was performed using a No. 10 mesh (2 millimeters [mm]) sieve followed by mixing, then a second sieving using No. 60 mesh (0.25 mm) and a second mixing event were performed. Use of the No. 10 mesh is based on a general definition of soil particle size (≤2 mm), and the No. 60 mesh is based on the USEPA definition of adherable soil for dermal evaluations (USEPA 2004). Analyses of soil test articles by ALS Environmental resulted in multiple re-mixing steps, because the relative standard deviations (RSDs) for analysis of triplicate samples could not achieve the project-specific 20 percent minimum goal. After three mixing steps, RSDs for four of five soil test articles passed minimum requirements. The soil test articles for sample GS-2 never achieved the 20 percent RSD

threshold. The GS-2 soil test article was re-mixed two times before sending to Ricerca for diet preparation. The decision to send soil sample GS-2 was made based on the aging of test animals.

Solvent extracts of duplicate soil test articles were prepared, and triplicate samples were analyzed for PAHs achieving the required level for analytical precision in the first round. Soil test articles and extracts were shipped to Ricerca for diet preparation.

Section 4 – Main Study *In vivo* Oral Bioavailability Testing: Ricerca used analytical data provided by ALS Environmental for soil test articles and extracts to develop test diets. Diets were developed based on 5 percent soil test article in diet preparation. Extract-based diets were prepared by matching the dose prepared for the 5 percent soil test article diet based on concentrations presented in the ALS Environmental analytical reports. A positive control diet was prepared using reagent-grade benzo(a)pyrene (BaP) at a concentration of 25 milligrams per kilogram (mg/kg). Triplicates of diet samples were sent to ALS Environmental for confirmation. Analytical results for PAHs in diet varied significantly, resulting in a change in analytical laboratories. Triplicate samples of diets were sent to AXYS Analytical for analysis of PAH concentrations, results from which demonstrated a high degree of precision with RSDs well below the targeted 20 percent. In addition, results presented by AXYS Analytical confirmed the high degree of agreement between calculated concentrations presented in the Ricerca diet formulations and reported concentrations in the AXYS data. The confirmation of PAH concentrations in test diets allowed for initiation of the feeding study. Fourteen-day animal testing was performed using female B6C3FI mice at four animals per cage, two cages per dose group. Measurements of body weight, feed consumption, urine production, and general animal health were recorded daily. Pooled urine samples from each of two cages per dose group were collected daily.

Section 5 – Main Study Urine Sample Analysis: Analytical testing was performed on pooled urine samples from multiple days to ensure adequate volume for testing and re-running samples if necessary. The Day 7 samples were pooled urine from Days 7 and 8 and the Day 14 samples were pooled samples from Days 14 and 15. Urine samples were analyzed for 3-hydroxy-BaP (3-OH-BaP), 9-hydroxy-BaP (9-OH-BaP), 3-hydroxy-benz(a)anthracene (3-OH-BaA), and 3-hydroxy-chrysene (3-OH-Chry).

Section 6 – Main Study *In vitro* Dermal Penetration Testing: Dermal penetration testing was performed *in vitro* using excised human skin in Franz Cells. Franz Cells are composed of two cells, one of which contains the test article and the other containing a saline receptor fluid with a surfactant that can receive the hydrophobic PAHs. The two cells are separated by an excised human skin sample, which acts as a semi-permeable barrier to PAHs. Human skin samples were fresh frozen samples obtained as the result of plastic surgery cases from five different donors. Test articles used included three soil test articles (GS-1, GS-2, and GS-3) based on their respective concentrations of PAHs, one soil sample spiked with 25 ppm BaP, one sample of pulverized target fragments (pure target fragments sieved to 0.25 mm), a test group exposed to1 mg/mL BaP in corn oil, and a positive control test group exposed to radio-labeled testosterone. Soil test articles were loaded onto the skin samples at a rate of 10 milligrams per square centimeter (mg/cm^2). Test articles were applied for 24 hours, then washed off. Samples of the receptor fluid were collected at intervals over a 72-hour period when the testing was terminated. At 72 hours, skin samples were stripped with tape to remove the non-viable stratum corneum. The dermis samples and the tape (stratum corneum) samples were extracted and analyzed for PAHs along with receptor fluid samples collected over the 72-hour testing period. Absorbed dose of PAHs were assumed to include PAHs detected in dermis samples and receptor fluid, while PAHs reported within or lodged on

top of the stratum corneum were assumed not to be available for dermal or systemic absorption. Data from the dermal penetration testing is reported for each individual PAH as a flux in units of picograms per square centimeter per hour (pg/cm^2/hr).

Section 7 – RBAF, ABS.d, and PCL Calculations: The RBAFs were calculated for each PAH tested with reportable concentrations of metabolites in urine. Daily doses of individual PAHs were calculated based on analytical and test animal data. In a similar approach, daily masses of individual PAH metabolites excreted in urine were also calculated. The fractional urinary excretion (FUE) for test animals exposed to PAHs applied to diet in soil test articles were compared to the FUE for animals exposed to PAHs in extracts. The ratios of FUEs for soil-based diets and extract-based diets were used to calculate the site-specific RBAFs for individual PAHs. ASB.d factors were calculated for individual PAHs based on dermal flux, soil loading to the skin, and PAH concentrations in soil. ABS.d factors were calculated based on the 72-hour time point for each of the five skin samples of each of the six test groups. The site-specific RBAFs and ABS.d values were then entered in the equation for calculating the commercial/industrial (C/I), direct-contact PCLs ($^{Tot}Soil_{Comb}$) for individual PAHs under TRRP.

2 PILOT STUDY

The PAH Bioavailability Pilot Test for the Site was conducted from January 2013 to May 2014. There were two main goals of the Pilot Study: 1) develop procedures to prepare homogeneous soil test articles that could be used in preparing reliable doses of PAHs in test animal diets from bulk soil samples collected from the Site, and 2) evaluate protocols for the execution and the overall sensitivity of this study protocol.

2.1 Pilot Study Sample Collection

Two bulk soil samples were collected on January 24, 2013 from areas within existing sampling grid G-3 as illustrated in Figure 1. Soil samples were collected from depth intervals just below the grass root zone down to approximately 3 to 4 inches at locations with high densities of visible target fragments. The samples were placed in sealable 5-gallon containers, sealed, and labeled for transport to ALS Environmental. Collection locations of the bulk soil samples were biased to obtain the highest available concentrations of PAHs in site soils. The purpose of the bias was to ensure that PAH doses would be high enough to detect gastrointestinal (GI) absorption by measurement of PAH metabolites in urine in the event of very low RBAs. The sampling event also included the collection of two 8-ounce soil samples from locations at the western end of the Victoria International Airport runway. The two samples were collected from locations that are likely to be impacted by deposition of PAHs associated with aircraft exhaust, and are expected to inform an understanding of potential interferences from other sources of PAHs at the Site. Finally, a 5-gallon bulk “clean” soil sample was collected from the property away from obvious anthropogenic sources of PAHs.

2.2 Pilot Test Article Preparation

The Pilot Study for the soil test article preparation had a number of goals including:

1. Determine the presence of other anthropogenic sources of PAHs associated with airport operations and aerial deposition from jet engine exhaust.
2. Provide data to support a conceptual site model (CSM) on the association of PAHs in soil with clay target fragments.
3. Evaluate soil sample drying to enhance success of sieving.
4. Evaluate procedures for development of soil test articles and extracts for bioavailability testing.

2.2.1 Evaluation of Background PAHs

The Site is located at the Victoria Regional Airport, where surface soils may also be impacted by the deposition of PAHs from the aircraft exhaust. To determine whether the Site is a good candidate site for bioavailability testing of PAHs in the coal tar pitch/limestone matrix of clay target fragments, two soil samples were collected at the end of one of the runways and analyzed to evaluate whether the presence of PAHs from airport activities would complicate data interpretation for the bioavailability study. One sample was analyzed, and results indicated that site soils contained no detectable concentrations of

PAHs at a reporting limit of 0.17 ppm. The laboratory reports, including the runway sample, are presented in Appendix A. Because the sample was collected from a location with the highest probability of impact from airport operation activities, it was assumed that there would be no interference with other sources of PAHs in analyzing bioavailability data. Analysis of the second sample was not required.

2.2.2 Evaluation of Soil Sample Drying

Because the bioavailability protocol centers on the sieving of soil samples to a 0.25 mm minus soil fraction, improving the sieving characteristics of the bulk soil samples was an important consideration. Drying soil samples with large fractions of clays is required prior to passing the soils through the sieves. Both air drying and oven drying techniques were evaluated. The initial concern was loss of PAHs to volatilization from oven drying. To test the effects of oven drying versus air drying, two soil subsamples from one bulk soil sample were set aside in aluminum pans for air drying and two soil subsamples from the same bulk soil sample were set aside in aluminum pans for oven drying at 140 degrees Celsius (°C). These samples were sieved with a No. 4 mesh (4.75 mm) prior to collection of subsamples. PAH concentrations were analyzed in soil subsamples before drying, post-drying, and post-sieving of dried samples.

The concentrations of the seven carcinogenic PAHs in pre-dried, post-dried, and post-dried/sieved soil samples are summarized in Table 1. PAH concentrations in pre-dried samples ranged from 39 mg/kg for dibenz(a,h)anthracene to 970 mg/kg for benzo(b)fluoranthene. Drying both by oven and air generally increased concentrations of PAHs, consistent with the conclusion that volatilization is not a major fate and transport pathway for high molecular weight PAHs in clay target fragments. Concentrations of PAHs in dried samples ranged from 120 mg/kg for dibenz(a,h)anthracene to 1,200 mg/kg for benzo(b)fluoranthene. Dried samples were sieved with a No. 60 mesh (0.25 mm) and analyzed for PAHs. The concentrations of PAHs in the dried, sieved samples ranged from 14 mg/kg for dibenz(a,h)anthracene to 120 mg/kg for benzo(b)fluoranthene. The sieved concentrations were consistently an order of magnitude below the pre-sieved samples.

Table 1 – Concentrations of PAHs in Bulk Soil Samples through Drying and Sieving Processes (mg/kg)

COC	Oven-dried 1	Oven-dried 2	Air-dried 1	Air-dried 2
Pre-dried				
Benz(a)anthracene	320	750	180	720
Benzo(a)pyrene	320	770	190	740
Benzo(b)fluoranthene	490	970	250	920
Benzo(k)fluoranthene	150	350	42	240
Chrysene	380	780	210	780

Indeno(1,2,3-cd)pyrene	42	66	50	47

COC = constituent of concern

Oven-dried soil samples exhibited visual differences compared to air-dried samples observed by laboratory personnel. Air-dried samples had clay target fragments that were difficult to distinguish from surrounding soil except for size and angular shapes. Clay target fragments in oven-dried samples became soft and rounded with increased plasticity. Examples of the differences in appearance are presented below in Figure 2.

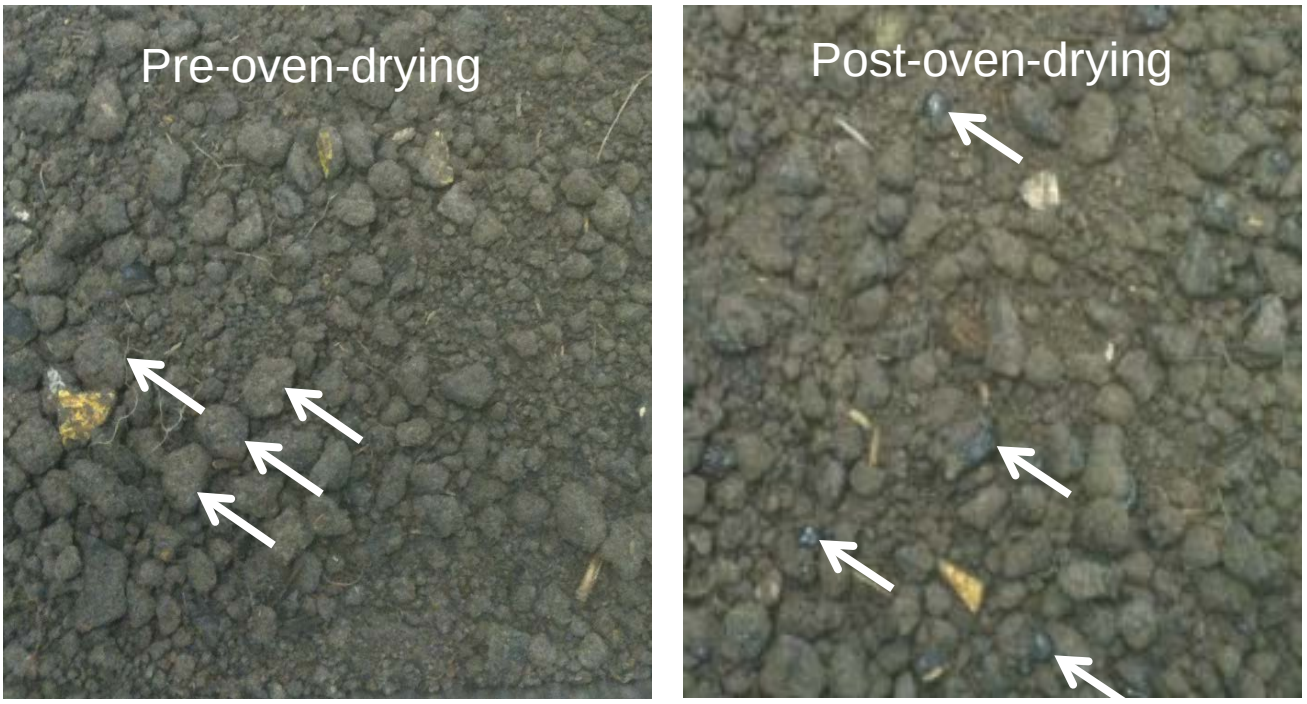

Figure 2 – Visible changes in Clay Target Fragments Observed in Bulk Soil Samples before and following Oven Drying

The Pilot Study results regarding approaches for drying soil samples before sieving was inconclusive with respect to initial and final concentrations of PAHs in samples due to the high frequency of small target fragments in the samples sieved with the No. 4 (4.75 mm) mesh. Initial concentrations of PAHs were reported from a minimum range of PAH concentrations between 14 mg/kg [dibenz(a,h)anthracene] and 110 mg/kg [benzo(b)fluoranthene] in one subsample tested compared with a maximum range of 160 [dibenz(a,h)anthracene] to 920 mg/kg [benzo(b)fluoranthene]. The high degree of variability was attributed to the frequency of fine fragment particles in the subsample aliquots.

Observations of softened target fragments in the oven-dried soil samples led to splitting a sample of No.4 sieved, mixed soil; one subsample was oven-dried, and one subsample was air dried. The two dried subsamples were then sieved using a No. 60 (0.25 mm) mesh. Analyses of these split samples, one oven-dried and one air-dried, resulted in BaP concentrations of 720 mg/kg and 32 mg/kg, respectively. These results indicate that oven-drying changes the physical state of coal tar pitch in target fragments and the chemical makeup of the soil immediately surrounding the fragments. Based on these evaluations conducted in the Pilot Study, oven-drying was subsequently not used as part of the soil test article preparation protocol. A summary of the head-to-head comparison of split soil sample results for drying then sieving is presented in Table 2.

Table 2 – Split Sample Drying Evaluation of Air-dried and Oven-dried Split Samples from Same Subsample of Bulk Soil (mg/kg)

COC	FAFB-BSS-G3-01 Oven-dried	FAFB-BSS-G3-01 Air-dried
Benz(a)anthracene	730	29
Benzo(a)pyrene	720	32
Benzo(b)fluoranthene	1,000	42
Benzo(k)fluoranthene	280	16
Chrysene	710	29
Dibenz(a,h)anthracene	110	4.1
Indeno(1,2,3-cd)pyrene	100	25

2.2.3 Relationship of PAHs and Clay Target Fragments in Soil

The CSM for PAHs in soil with clay target fragments at trap and skeet ranges is based on the primary mechanism for movement of PAHs from the coal tar pitch/limestone matrix of the clay target fragments to soil is mechanical weathering of clay target fragments down to smaller particles that become part of the fine-grained soil matrix. Previously, SPLP and toxicity characteristic leaching procedure (TCLP) testing of clay target fragments indicated that PAHs did not appreciably leach from pulverized target fragments under acidic conditions associated with landfills or aqueous conditions associated with infiltrating precipitation. Consequently, dissolution of PAHs from target fragments and adsorption to soil was assumed to be a secondary fate and transport mechanism. To confirm mechanical weathering as the primary mechanism for the movement of PAHs from target fragments to soil, a subsample of the bulk soil sample was separated by particle size, and each soil fraction was analyzed for PAHs. If concentrations of PAHs increased with decreasing particle size, then dissolution and adsorption of PAHs to soil would be the primary fate and transport mechanism resulting in PAH concentrations in soil. If, however, concentrations of PAHs decreased with decreasing particle size, then mechanical weathering of clay target fragments into smaller and smaller particles until becoming part of the soil matrix would be the primary fate and transport mechanism. Under this latter mechanism, the PAHs would still be in the coal tar pitch/limestone matrix but in very small fragments. Table 3 provides a summary of the PAH concentrations in fractionated soil samples based on particle size following the series sieving. Five soil fractions were analyzed as follows:

1. Sieve Sample 1: >1mm (No. 18 mesh) and <2mm (No. 10 mesh)
2. Sieve Sample 2: >0.25mm (No. 60 mesh) and <1mm (No. 18 mesh)
3. Sieve Sample 3: >0.15mm (No. 100 mesh) and <0.25mm (No. 60 mesh)
4. Sieve Sample 4: >0.05mm (No.270 mesh) and <0.15mm (No. 100 mesh)
5. Sieve Sample 5: <0.05mm (No. 270 mesh)

Table 3 – PAH Concentrations in Particle Size-fractionated Soil Samples (mg/kg)

COC	Sieve Sample #1	Sieve Sample #2	Sieve Sample #3	Sieve Sample #4	Sieve Sample #5
Benz(a)anthracene	290	120	63	63	66
Benzo(a)pyrene	300	140	74	74	74
Benzo(b)fluoranthene	450	210	110	110	130
Benzo(k)fluoranthene	110	46	38	30	38
Chrysene	55	46	42	49	62
Dibenz(a,h)anthracene	63	40	24	25	29
Indeno(1,2,3-cd)pyrene	260	120	68	67	75

The PAH data for these five, particle size-fractionated samples clearly show that the highest concentrations are observed in the coarsest fraction (Sieve Sample #1: >1 mm and <2 mm). All PAH concentrations decrease in Sieve Sample #2, as the particle size decreases to >0.25 mm and <1 mm. The PAH concentrations continue to decrease further with decreases in particle sizes as shown by results from Sieve Sample #3 (>0.15 mm to <0.25 mm). Then for Sieve Samples #4 and #5, the PAH concentrations are very similar to those reported in Sample #3. The PAH data are comparable for all particle sizes <0.25 mm. These data support the conclusion that mechanical weathering is the primary fate and transport mechanism for the PAHs until particle size is <0.25 mm. Dissolution of PAHs is not occurring to any measurable extent from this matrix, resulting in consistent concentrations of PAHs in the finer soil fraction (adherable fraction less than 0.25 mm).

Analytical results for soil fraction as part of the Pilot Study included concentrations of PAHs and total organic carbon (TOC) as follows:

- >1 mm and <2 mm TOC – 6.81%
- >0.25 mm and <1 mm TOC – 4.82%
- >0.15 mm and <0.25 mm TOC – 3.66%
- >0.05 mm and <0.15 mm TOC – 4.45%
- <0.05 mm TOC – 4.65%

The laboratory had to employ aggressive sieving techniques with large soil volumes and rigorous shaking to obtain a soil fraction below 0.1 mm. A minimal amount of soil volume was obtained below the 0.15 mm and 0.05 mm sieve sizes. The fragile clay target fragments may have been broken down into finer particle sizes through the aggressive agitation, resulting in a potential high bias for PAH concentrations in these finer soil fractions. This is supported by the TOC data. The percentages of TOC in soil samples decreased with fraction size from 1 mm to 2 mm (6.81%) down to 0.15 mm to 0.25 mm (3.66%); however, particle sizes below 0.15 mm exhibited elevated TOC (4.45% to 4.65%). The data support the CSM, which indicates that PAHs in site soil remain in the coal tar pitch/limestone matrix of the target fragments

due to mechanical breakdown of the fragments into smaller particles. The degree of bioavailability of PAHs in soil samples from these skeet range sites, therefore, is primarily related to the coal tar pitch/limestone matrix of the clay target fragment rather than the adsorption characteristics of the soil matrix. This is supported by recent work by Xia et al. (2016).

2.2.4 Preparation of Pilot Study Soil Test Articles and Extracts

The goal of the soil sieving and analysis process was to prepare an adherable soil fraction (≤0.25 mm) sample with known, reproducible concentrations of PAHs to serve as the basis for preparing the soil test articles for the bioavailability study. Soil samples were initially collected in 5-gallon buckets on January 24, 2013. Initial soil test articles, fragment test articles, and extracts were prepared in January 2014. Three attempts were made to sieve and mix soil test articles before successfully achieving the 15 percent RSD goal. All but two COCs in different media exhibited RSDs below 15 percent. A summary of the analyses of the triplicate sample concentrations of PAHs for soil and pulverized fragment test articles is presented below in Table 4.

Table 4 – Analytical Results for Triplicate Soil and Fragment Test Article (mg/kg)

COC	1st Replicate	2nd Replicate	3rd Replicate	Average	St. Dev.	RSD (%)
Soil Test Article						
Benz(a)anthracene	200	240	250	230	26	11.5
Benzo(a)pyrene	220	280	260	253	31	12.1
Benzo(b)fluoranthene	270	320	310	300	26	8.8
Benzo(k)fluoranthene	87	77	95	86	9.0	10.4
Chrysene	220	280	260	253	31	12.1
Dibenz(a,h)anthracene	53	43	36	44	8.5	19.4
Indeno(1,2,3-cd)pyrene	180	260	220	220	40	18.2
Fragment Test Article						
Benz(a)anthracene	1,100	1,100	1,000	1,067	58	5.4
Benzo(a)pyrene	1,200	1,300	1,300	1,267	58	4.6
Benzo(b)fluoranthene	1,500	1,600	1,500	1,533	58	3.8
Benzo(k)fluoranthene	490	320	360	390	89	23
Chrysene	1,200	1,200	1,200	1,200	0	0.0
Dibenz(a,h)anthracene	160	170	160	163	5.8	3.5
Indeno(1,2,3-cd)pyrene	950	920	970	947	25	2.7

Eleven extracts were prepared and combined for preparation of each of the extract test articles. Eleven 30-gram soil test article and fragment test article subsamples were each extracted with 10 milliliters (mL) of methylene chloride. As a result, a total of 330 grams of soil test article and 330 grams of fragment test article were extracted each in 110 mL methylene chloride. In response to a comment from the TCEQ, the methylene chloride was blown dry for each of these samples, and the soil test article extract and fragment test article extract were each re-suspended in 110 mL of acetone. The purpose of the solvent change was to closely duplicate the procedures in the Beland and Culp (1998) study. Analytical results for triplicate samples of soil extract and fragment extract test articles in acetone are summarized in Table 5. All but one COC in the soil extract test article, benzo(k)fluoranthene, exhibited an RSD below 15 percent.

Table 5 – Analytical Results for Triplicate Extracts of Soil and Fragment Test Articles in Acetone (mg/L)

Indeno(1,2,3-cd)pyrene	850	820	770	813	40	5.0

The soil test article, fragment test article, and extract test articles were delivered to Ricerca for preparation of Pilot Study diets. Much of the coal tar pitch components in the acetone extract came out of solution and adhered to the sides of the sample vials during shipment prior to diet preparation. Sample vials were rinsed with methylene chloride to re-suspend the coal tar pitch precipitates. The methylene chloride rinsate was added to the extract stock diet to preserve the original mass of extracted PAHs from soil test articles and fragment test articles.

2.3 Oral Bioavailability Dosing Pilot Study

The central goal of the Pilot Study was to fine-tune the Investigation Plan for the PAH Bioavailability Main Study. The oral bioavailability dosing study was divided into two subtasks: 1) diet preparation and animal dosing, and 2) monitoring and urine collection. Each of these is discussed below.

2.3.1 Diet Preparation

In the Pilot Study, three diets were prepared using the soil test articles at 5%, 10%, and 20% soil composition by mass in diets. In addition, one diet was prepared with the fragment test article at 10% by mass in diet. Detailed descriptions of the diet preparation are presented in Appendix B. Two diets were prepared using extracts, one diet dose matched to the 10% soil diet using the soil extract, and one diet dose matched to the 10% fragment diet using the fragment extract. Finally, control diets included a negative control composed of 10% clean soil in diet and a positive control composed of 25 ppm of reagent-grade BaP in diet. The diets were analyzed to determine actual concentrations of the seven target PAHs.

Extracts for both soil and fragment test articles exhibited large amounts of tar residue on the sides of the sample vials, indicating that the acetone was not capable of maintaining the components of the coal tar pitch in solution. The precipitation of tar on the sides of the sample vials changed the method for developing the extract diets. The revised approach was to place the entire volume of acetone on 68 grams of diet, followed by rinsing the vials three times with methylene chloride to remove the tar residue. The entire volume of solvents and coal tar pitch was applied to the diet, and the solvents were blown down using nitrogen. Once dry, a sample of each extract diet was shipped to ALS Environmental overnight for 24-hour analysis of PAHs. The extract diets were then diluted with fresh diet to achieve the desired concentrations of BaP to match their respective test article diets.

A total of eight diet groups were prepared as follows:

1. Negative Control Diet – 10% Clean Soil
2. Positive Control Diet – 25 ppm Reagent-Grade BaP
3. 5% Soil Test Article
4. 10% Soil Test Article
5. 20% Soil Test Article
6. Soil Extract Dose Matched to 10% Soil
7. 10% Fragment Test Article
8. Fragment Extract Dose Matched to 10% Fragments

Once diets were prepared, triplicate samples from five diets were collected from the top, middle, and bottom of each diet container. Triplicate diet samples were shipped to ALS for analysis of PAHs including 10% Soil diet (Group 4), Soil Extract diet (Group 6), 10% Fragment diet (Group 7), Fragment Extract diet (Group 8), and 25 ppm Positive Control diet. Three diets exhibited RSDs above the 15 percent goal including BaP (50%) in Group 2; benzo(b)fluoranthene (19%) and benzo(k)fluoranthene (23%) in the Group 4 diet; and benz(a)anthracene (20%), BaP (18%), chrysene (20%), dibenz(a,h)anthracene (27%),

and indeno(1,2,3-cd)pyrene (19%) in the Group 8 diet. Table 6 provides a summary of PAH concentrations in the Pilot Test diets.

Table 6 – Analytical Results for Triplicate Diet Samples (mg/kg)

COC	1st Replicate	2nd Replicate	3rd Replicate	Average	St. Dev.	% RSD
25 ppm B(a)P Positive Control (Group 2)						
Benzo(a)pyrene	14	20	6.6	14	6.7	49.6
10% Soil Diet (Group 4)

Benzo(k)fluoranthene	57	58	65	60	4.4	7.3
Chrysene	130	120	130	127	5.8	4.6
Dibenz(a,h)anthracene	33	33	36	34	1.7	5.1
Indeno(1,2,3-cd)pyrene	78	82	90	83	6.1	7.3

COC	1st Replicate	2nd Replicate	3rd Replicate	Average	St. Dev.	% RSD
Fragment Extract Diet (Group 8)						
Benz(a)anthracene	69	100	100	90	17.9	20
Benzo(a)pyrene	83	110	120	104	19.1	18
Benzo(b)fluoranthene	91	120	120	110	16.7	15
Benzo(k)fluoranthene	49	60	62	57	7.0	12
Chrysene	96	130	130	119	19.6	17
Dibenz(a,h)anthracene	18	30	30	26	6.9	27
Indeno(1,2,3-cd)pyrene	52	73	74	66	12.4	19

The analytical reports for the diet samples are presented in Appendix A. The RSDs for Group 4 (10% Soil diet) and Group 8 (Fragment Extract diet) exceeded the project-specific 15 percent threshold. Group 4 had relatively high results for all PAHs in the first replicate, while Group 8 had relatively low concentrations for all PAHs reported in the first replicate. These results may have introduced a slightly high bias for the Group 4 results and a slightly low bias for the Group 8 results, but do not affect the overall interpretation of the study results. Group 2 (25 ppm BaP-spiked diet) exhibited a very high RSD of 49.6 percent with all three individual concentrations of BaP unrelated, and none of the three analytical results near the targeted 25 ppm. The Group 2 diet, therefore, carried too high an uncertainty for interpreting the data. The diet was prepared by adding a small volume of BaP in solvent to the total volume of diet. This approach led to an uneven distribution of BaP in the diet. The Main Study protocol was revised to use a BaP spiked to the diet using 100 mL of solvent to obtain an even loading of BaP in a manner similar to the extract diets. These were much more homogeneous with respect to uniform concentrations of PAHs compared to the Pilot Study BaP-spiked diet.

2.3.2 Animal Dosing, Monitoring, and Urine Collection

This section describes the preparation of test diets and the *in vivo* bioavailability study for PAHs for the soil and extract test articles from the Pilot Study sample collection and preparation tasks. Ricerca performed the diet preparation and *in vivo* testing tasks. As described in the Investigation Plan (Pika-Malcolm Pirnie 2014), *in vivo* testing was performed using B6C3F1 mice with four mice per test group. Mice were housed in metabolism cages to allow for collection of 24-hour pooled urine samples, separating food and fecal matter from urine collection vessels to minimize the potential for cross-contamination of PAH metabolites from fecal matter with urine. Appendix B provides the Pilot Study Report prepared by Ricerca summarizing the *in vivo* portion of the study.

Monitoring data collected during the 14-day animal feeding period included: daily body weight, daily diet consumption, and general condition of test animals. The study did not include measurement of urine volume. Urine samples were photographed daily in conical tubes to observe volume and color. Volumes were estimated from photographs, and measurements were made by the analytical laboratory. There is a high degree of uncertainty associated with the estimated urine volumes. (The Main Study protocol has been modified to include quantitative urine volume measurements.) Animals in Groups 1 through 6 were

dosed for the entire 14-day period. The test animals in Group 8 (Fragment Extract diet) demonstrated signs of acute toxicity requiring termination of dosing at 9 days. Test animals for Group 8 were euthanized based on study protocol on Day 9. Table 7 provides a summary of body weights, food consumption rates, and urine production estimates for Days 7 and 14 of the testing period.

Table 7 – In-life Monitoring Average Body Weight, Food Consumption, and Urine Production for Test Animals on Days 7 and 14

	Group 1 Control	Group 3 5% Soil BaP – 13 ppm	Group 4 10% Soil BaP – 27 ppm	Group 5 20% Soil BaP – 53 ppm	Group 6 Soil Extract BaP – 25 ppm	Group 7 Fragment BaP – 123 ppm	Group 8 Frag. Ext. BaP – 104 ppm
Day 7							
Body Weight (g)	24.3	24.2	22.0	22.1	22.2	20.8	18.5
Food Intake* (g/day)	4.3	4.0	4.1	3.5	2.9	2.0	2.2
Urine Prod. (mL/day)	1.5	1.2	1.0	1.2	1.6	2.2	2.6
Day 14							
Body Weight (g)	23.6	24.2	22.6	21.4	22.7	**	**
Food Intake* (g/day)	3.3	3.4	3.3	3.5	3.1	**	**
Urine Prod. (mL/day)	1.2	1.5	0.8	1.4	1.1	**	**

* Food intake rate based on the averages for Days 6/7 and Days 13/14.

** Group 7 and Group 8 animals euthanized due to weight loss and sickness evident in Group 8 animals at Day 9.

The body weights and food intake rates of Group 1 (Control diet) and Group 3 (5% Soil diet) were the same, indicating that 5 percent soil in diet had no effect on feeding and growth. Group 4 (10% Soil diet), Group 5 (20% Soil diet), and Group 6 (Soil Extract diet) all exhibited about a 10 percent decrease in body weight and between 10 and 20 percent decrease in food consumption on Day 7, with a return to control levels by Day 14. The 10% Fragment diet (Group 7) and Fragment Extract diet (Group 8) animals had significant decreases in body weight and food consumption. The mice in Group 8 showed signs of acute toxicity, requiring termination due to their state of health by Day 9. For the Fragment and Fragment Extract groups, body weight was down by 20 percent and food consumption was half that of the Control diet. Although urine volume data for the Pilot Study are highly uncertain, it was clear that urine volumes in the Fragment and Fragment Extract groups were elevated compared to other groups.

2.4 Urinary PAH-metabolite Analytical Method Development

The PAH Bioavailability Pilot Study included method development for analysis of PAH metabolites in urine. The target PAHs were determined by the availability of standards for analysis of metabolites. Standards were identified for three metabolites for BaP including 3-OH-BaP, 9-OH-BaP, and 7,8-dihydrodiol-BaP (cis/trans). Two other PAHs had standards for metabolites: benz(a)anthracene and chrysene (3-OH-BaA and 3-OH-Chry). The metabolites and standards for the isomers of the 7,8-dihydrodiol-BaP metabolites were not sufficiently sensitive to be of use at the concentration found in mouse urine under the exposures presented. The dihydrodiol metabolite, therefore, was removed from the evaluation.

Analysis of the hydroxy-metabolites for PAHs was optimized by including both the Phase I hydroxyl metabolites and the Phase II glucuronides and sulfonates by the deconjugation via enzymatic hydrolysis. In addition, the hydroxyl metabolites (3-OH-BaP in particular) are readily degraded by photolysis and oxidation. Urine samples were spiked with 2-mercaptoethanol as an anti-oxidant to prevent oxidation of the analytes. The samples were also spiked with a suite of labeled quantification standards and labeled derivatization monitoring standards to improve sensitivity and accuracy.

The method derived for analysis of the select PAH metabolites included the following steps:

1. Obtain 4 mL of urine sample;
2. Spike with 2-mercaptoethanol to prevent oxidation;
3. Add:
    i. Quantification standards;
    ii. De-conjugation standards;
    iii. β-Glucuronidase enzyme;
4. Incubate at 37oC for 17 hours;
5. Extract three times with 4 mL of pentane;
6. Add:
    i. Derivatization control standards;
    ii. Recovery standards;
    iii. Derivatize with N-methyl-N-(trimethylsilyl)trifluoroacetamide (MSTFA) at 60oC; and
7. Analyze by high-resolution gas chromatography/high-resolution mass spectrometry (HRGC/HRMS).

2.5 Pilot Test Urine Analysis

Urinary metabolites for PAHs typically represent less than 1 percent of the administered dose. The addition of an antioxidant to the extraction prevented the oxidation loss of PAH metabolites, principally 3-OH-BaP. The results of PAH metabolite analyses in urine samples are presented in Appendix C. The units for measuring PAH metabolites are expressed in micrograms per liter (µg/L).

Table 8 – PAH Metabolites in Urine Samples (µg/L)

COC	Group 1 Negative Control	Group 3 5% Soil Test Article	Group 4 10% Soil Test Article	Group 5 20% Soil Test Article	Group 6 Soil Extract	Group 7 10% Fragment Article*	Group 8 Fragment Extract*
Day 7 Urine Samples							
3-OH-Benzo(a)pyrene	0.0459	103	363	394	466	491	1,370
9-OH-Benzo(a)pyrene	0.282	72.6	256	295	360	427	1,230
3-OH-Benz(a)anthracene	<0.353	11.8	34.1	39.5	33.1	33.8	138
3-OH-Chrysene	<0.271	60.1	102	113	99.7	106	282
Day 14 Urine Samples							
3-OH-Benzo(a)pyrene	0.0848	103	375	368	771	421	1,630
9-OH-Benzo(a)pyrene	0.187	57.5	315	278	592	323	1,280
3-OH-Benz(a)anthracene	<0.272	7.78	33.5	41.8	57.8	43.3	161
3-OH-Chrysene	<0.21	50.8	127	99.6	149	101	366

* Group 8 mice were euthanized due to health on Day 9, Group 7 dosing was terminated along with Group 8 on Day 9. Analytical results for PAH metabolites from urine samples collected on Day 9 instead of Day 14.

Metabolites for all three PAHs were detected in urine from Groups 3 through 8. The concentrations of 3-OH-BaP and 9-OH-BaP were consistently higher than 3-OH-Chry, while concentrations of 3-OH-BaA were the lowest among the metabolites; consistently an order of magnitude below those for the hydroxyl metabolites of BaP. Urinary concentrations of PAH metabolites had little relation to the concentrations of PAHs in the diet due to the variation of amounts of diet ingested and volumes of urine excreted. The calculated molar mass of PAHs ingested must be compared to molar mass of PAH metabolites excreted to determine any relationship between concentrations in exposure media and variation in absorption.

2.6 Pilot Test RBAF Calculations and Conclusions

The data analysis for the Pilot Study included calculation of RBAFs by comparison of the ratio between doses of parent PAHs ingested by mice and corresponding masses of PAH metabolites in urine for PAHs dosed in the soil matrix (i.e., the FUE). This same comparison was made for the doses and masses in the extract (solvent) matrix. The RBAF is a point-wise ratio of these two values. Once calculated, the PAH-specific RBAFs are used to calculate site-specific PCLs. The RBAF calculations are presented in Appendix D and summarized below.

2.6.1 RBAF Calculations

RBAFs were developed for target metabolites analyzed in urine. RBAFs are calculated for BaP based on both 3-OH-BaP and 9-OH-BaP metabolites for both the Day-7 and Day-14 sample sets. RBAFs were also

calculated for benz(a)anthracene and chrysene based on their 3-hydroxy metabolites. RBAFs for fragment and fragment extract groups (Group 7 and Group 8) were calculated for Day 7 and Day 9. RBAFs were applied to remaining target PAHs as surrogates based on similar chemical and physical parameters.

For each diet test group, the average dose of BaP was calculated from the concentration of BaP in the diet and the amount of diet consumed. The average daily dose was converted to units of micromoles per day (µmole/d) based on the chemical-specific molecular weight. FUE was calculated as follows:

$$= \frac{(Mass\ of\ BaP\ metabolites\ in\ the\ 24-hour\ pooled\ urine\ sample\ at\ day\ X)}{(Mass\ of\ BaP\ consumed\ 24\ hours\ before\ urine\ collection\ on\ day\ X)}$$

The FUEs were calculated for the animals dosed with the 10% Soil Test Article diet (Group 4) and for animals dosed with the Soil Extract diet (Group 6). These were designated FUE_{soil} and $FUE_{extract}$. The same approach was taken for the 10% Fragment Test Article diet (Group 7) and the Fragment Extract diet (Group 8).

The RBAF was defined as the ratio of the two FUE metrics as follows.

$$RBAF = (FUE_{soil})/(FUE_{extract})$$

Table 9 – RBAF Calculation Summary for Soil Samples

COC	Oral Dose (µmole/d)		Excreted in Urine (µmole/d)		FUE_{soil}	$FUE_{extract}$	RBAF

3-OH-Benz(a)anthracene	3.19	3.10	0.00169	0.00429	0.00053	0.00138	0.38
3-OH-Chrysene	3.82	4.10	0.00393	0.01034	0.00103	0.00252	0.41

The Pilot Test conducted concurrent with the Pilot Study at the Former Laredo AFB conservatively supports the application of RBAFs as follows:

- BaP – Range 28 to 34 percent with an average of 31 percent
- Benz(a)anthracene – Range from 35 to 37 percent with an average of 36 percent
- Chrysene – Range from 42 to 57 percent with an average of 50 percent

The RBAFs for the pulverized target fragments were comparable with concentrations of individual PAHs approximately five times the reported soil concentrations. These data indicate that the relative absorption of PAHs in the GI tract is not dose-dependent at high concentrations. As previously stated in Section 2.3.2, volumes of urine were not recorded as part of the daily record keeping. This factor has led to a high degree of uncertainty in the calculated values for RBAF as part of the Pilot Test. Based on the Pilot Study, the Main Study protocol has included quantitative record keeping concerning daily urine production.

2.6.2 Pilot Study Conclusions

The PAH Bioavailability Pilot Study demonstrated that the protocol presented in the Investigation Plan (Pika-Malcolm Pine 2014) is capable of producing usable data to estimate the site-specific RBAFs for PAHs within target fragments in soil at the Site. Results of the Pilot Study identified the following procedures to be included in the protocol for the Main Study:

1. Air-dry bulk soil samples prior to sieving and mixing;

2. Sieve bulk soil samples with a #10 mesh (2 mm) screen, mix, then sieve with a #60 mesh (0.25 mm) screen followed by a second mixing. The two-staged mixing following sieving was the best method to achieve the target RSD providing a reproducible test article representing the portion of site soils adherable to skin;
3. The target RSD should be 20 percent instead of 15 percent based on Pierre Gy's sampling theory and a 0.25 mm particle size. Additional information on Pierre Gy's sampling theory is provided in section D.2. (Pierre Gy's Sampling Theory) of Appendix D of USACE EM 200-1-7 Performance Evaluation (PE) Program (USACE 2001) and 'Sampling of Heterogenous and Dynamic Material Systems: Theories of Heterogeneity, Sampling, and Homogenizing (Data Handling in Science and Technology) (Gy 1992);
4. Prepare extracts of soil test articles using methylene chloride and apply directly to diets to keep coal tar pitch in solution;
5. Prepare soil diets at 5% soil by mass;
6. Collect daily urine volume data; and
7. Use antioxidants to control auto-oxidation of hydroxyl PAH metabolites in urine samples during the de-conjugation, extraction, and derivatization steps.

3 MAIN STUDY SAMPLE COLLECTION AND TEST ARTICLE PREPARATION

3.1 Soil Sample Collection

Ten bulk soil samples were collected from the Site on November 24, 2014 for use in bioavailability testing to establish site-specific RBAFs under TRRP. Bulk soil samples were collected in 5-gallon buckets and consisted of two samples each from five locations. The sample locations were from grids G-1 through G-5 at the Site (Figure 3) and were collected from the 0 to 0.5-foot (0 to 6-inch) depth interval. Samples were identified as GS-1 through GS-5 based on the grid locations where the samples were collected. Sample locations were selected to provide a range of potential PAH concentrations from approximately 0.1 ppm for individual PAHs to greater than 100 ppm. The samples were projected to provide a range of several orders of magnitude to determine any potential dose/response relationship. The samples were placed in sealable 5-gallon containers, sealed, and labeled for transport to the analytical laboratory.

For this study, sample nomenclature is as follows:

1. Bulk soil sample refers to the 5-gallon field soil sample prior to any sieving, mixing, or analysis.
2. Sieved soil sample refers to the soil sample that has been sieved with No. 10 (2 mm) mesh, mixed, sieved with No. 60 (250 µm) mesh, and re-mixed.
3. Soil test article refers to 0.25 mm (250-micron) sieved soil sample that has been tested for PAH concentrations and approved for use in diet preparation.
4. Soil extract test article refers to the methylene chloride extracts of the soil test article that have been combined, tested for PAH concentrations, and approved for diet preparation.

3.2 Soil Sample Sieving and Analysis

Bulk soil samples were air-dried for 3 weeks prior to sieving. Sieving activities were initiated in January 2015, with the first soil test articles available at the end of the month for analysis of PAHs. Soil samples were first sieved using a No. 10 mesh (2 mm) screen, then mixed. The second sieving was performed with No. 60 mesh (0.25 mm) screen, and samples were re-mixed. Sieved soil samples were analyzed during the last week of January and the first week of February 2015. The triplicate subsamples from sieved samples GS-1, GS-3, and GS-4 achieved the project-specific 20 percent RSD goal. The triplicate subsamples from sieved soil samples GS-2 exhibited the highest concentrations of PAHs (generally greater than 100 ppm for individual compounds), while GS-5 yielded triplicate subsamples with the lowest concentrations of PAHs (generally below 0.1 ppm).

Sieved soil samples for GS-2 and GS-5 were re-mixed including additional tumbling. A second round of PAH analyses in February 2015 for triplicate subsamples for GS-2 and GS-5 failed the 20 percent RSD goal a second time. A final re-mix was performed on the samples for GS-2 and GS-5, and triplicate subsamples were collected and analyzed in March 2015. The analysis of triplicate samples for GS-5 indicated that the GS-5 soil test article passed the 20 percent RSD goal. Although improved, the analysis

of triplicate subsamples for soil test article GS-2 exhibited RSDs ranging from 28 to 79 percent. The decision was made to move forward with diet preparation in March 2015 after 2 months of delay with soil test article preparation. A summary of the analytical results for PAH concentrations is presented in Table 11, and associated laboratory reports are presented in Appendix E. As noted in the following section, the issue was later determined to be laboratory imprecision and not sample heterogeneity.

3.3 Test Article Extract Preparation

The soil test articles were each divided into two aliquots. One aliquot was maintained as a soil test article to be used as the test article for dosing soil-based feed. The second aliquot was bulk Soxhlet extracted with methylene chloride. The extract remained in methylene chloride and was used as the test article for dosing extract-based feed. The analytical results for the extracts are presented below (Table 12) in milligrams per liter (mg/L):

Analytical results for extract triplicate analyses indicated that extracts for GS-1, GS-2, and GS-4 yielded all seven PAHs with RSDs below the 20 percent goal. Extracts for GS-3 and GS-5 each yielded six of seven PAHs with RSDs below 20 percent. Only benzo(k)fluoranthene and benzo(b)fluoranthene exhibited RSDs greater than 20 percent with 27 percent in GS-3 and 28 percent in GS-5, respectively. Soil and extract test articles were sent to Ricerca for diet preparation and *in vivo* testing.

4 *IN VIVO* ORAL TESTING

This section describes the preparation of test diets and the *in vivo* bioavailability study for PAHs for the soil and extract test articles for the Main Study sample collection and preparation tasks. Ricerca performed the diet preparation and *in vivo* testing tasks as described in Section 3. Appendix F provides the Main Study Report prepared by Ricerca summarizing the *in vivo* portion of the study.

4.1 Dose Medium Preparation

The dietary matrix for the bioavailability study used soil and extract test articles (sieved, adherable soil sample and extract) mixed into NIH 31 meal rodent diet, recommended in the Investigation Plan (Pika-Malcolm Pirnie 2014) because this diet was used by Beland and Culp (1998). Ricerca prepared 12 diets for testing:

Diet #1 – Negative Control Diet – based on 10 percent of the diet by mass made up of “clean” soil, sieved and prepared in the same manner as the soil test article. The analytical results for PAHs of the clean soil sample were non-detect at sample detection limits ranging from 0.1 mg/kg for benz(a)anthracene to 0.17 mg/kg for chrysene.

Diet #2 – BaP Positive Control Diet – based on spiking diet with 0.67 mg/kg reagent-grade BaP in 107 mL methylene chloride, mixed, and solvent blown down with nitrogen

Diet #3 – GS-1 Soil Test Article Diet – based on 5 percent of diet by mass made up of GS-1 soil test article assuming 4.5 mg/kg BaP in soil test article for a final concentration of 0.22 mg/kg BaP in diet

Diet #4 – GS-2 Soil Test Article Diet – based on 5 percent of diet by mass made up of GS-2 soil test article assuming 183 mg/kg BaP in soil test article for a final concentration of 9.15 mg/kg BaP in diet

Diet #5 – GS-3 Soil Test Article Diet – based on 5 percent of diet by mass made up of GS-3 soil test article assuming 28 mg/kg BaP in soil test article for a final concentration of 1.42 mg/kg BaP in diet

Diet #6 – GS-4 Soil Test Article Diet – based on 5 percent of diet by mass made up of GS-4 soil test article assuming 0.54 mg/kg BaP in soil test article for a final concentration of 0.03 mg/kg BaP in diet

Diet #7 – GS-5 Soil Test Article Diet – based on 5 percent of diet by mass made up of GS-5 soil test article assuming 0.11 mg/kg BaP in soil test article for a final concentration of 0.006 mg/kg BaP in diet

Diet #8 – GS-1 Extract Diet – based on matching the concentration of Diet #3 using GS-1 Extract to a target BaP concentration of 0.22 mg/kg

Diet #9 – GS-2 Extract Diet – based on matching the concentration of Diet #4 using GS-2 Extract to a target BaP concentration of 9.17 mg/kg

Diet #10 – GS-3 Extract Diet – based on matching the concentration of Diet #5 using GS-3 Extract to a target BaP concentration of 1.42 mg/kg

Diet #11 – GS-4 Extract Diet – based on matching the concentration of Diet #6 using GS-4 Extract to a target BaP concentration of 0.03 mg/kg

Diet #12 – GS-5 Extract Diet – based on matching the concentration of Diet #7 using GS-5 Extract to a target BaP concentration of 0.01 mg/kg

Three subsamples of each diet mixture were collected from the top, middle, and bottom of the diet-specific storage bins. The diet samples in triplicate were shipped to AXYS Analytical for analysis of the concentrations of PAHs in each diet mixture. Laboratory reports for diet analyses are presented in Appendix G. A summary of the analytical results for the diet samples is presented below.

The diet analyses indicate that RSDs only exceeded the 20 percent goal in the GS-5 Soil Test Article Diets (Diet #7). These samples exhibit PAH concentrations ranging from 0.0006 mg/kg to 0.0075 mg/kg, below the method reporting level. These levels are at or below background levels and will not be detectable as metabolites in urine. The exceedances of the threshold RSD, therefore, will not affect interpretation of bioavailability testing results.

All other diets exhibited reported RSDs well below the project-specific goal of 20 percent with RSDs for the soil test article diet samples ranging from 1.3 to 19 percent and the extract test article diet samples ranging from 0.3 to 12 percent. The extract diet and BaP positive control diet exhibited the lowest RSDs, indicating very high certainty for predicting the dose in these samples. The RSDs for the soil test article diet samples indicated a higher potential for variability in the administered doses to test animals. The GS-2 Soil Test Article never achieved the RSD goal as part of the soil testing program; however, Diet #4 (made from GS-2) exhibited RSDs ranging from 1.6% to 12%. The concentrations of BaP in Diet #9 triplicate subsamples averaged 10 mg/kg compared to the target concentration of 9.17 mg/kg for Diet #9 (GS-2 Extract Diet), indicating a high degree of precision in Ricerca's calculation and preparation of diets.

The reported concentrations for the GS-2 Soil Test Article were used to calculate the target concentrations for Diet #4 (GS-2 Soil Diet) and Diet #9. The concentration of BaP in Diet #4 was 19 mg/kg, double that predicted by the target concentration calculation. The GS-2 Extract diet (Diet #9) was prepared using the GS-2 Extract independent of the GS-2 Soil Test Article. The RSDs for both diets were less than 5 percent, indicating a very well mixed and prepared diet sample. At 5% soil in diet, the corresponding soil concentration of BaP in the GS-2 Soil Test Article was 380 mg/kg based on the 19 mg/kg in Diet #4. This estimate of the GS-2 concentration is consistent with the difficulty that ALS Environmental experienced in trying to achieve the target 20 percent RSD goal for this sample. These results indicate that the estimated concentration for BaP based on the AXYS *diet* data are more representative of actual conditions than the ALS soil data.

4.2 *In Vivo* Testing

The Main Study required 12 dose groups based on the 12 diet preparations presented above. Each dose group included two metabolism cages, with four mice per cage, for a total number of 96 mice for the Main Study. Ricerca acclimated mice to experimental conditions 47 days prior to administration of test diets. Mice were monitored daily for body weight, weight gain (loss), food consumption (grams of diet), urine production (mL urine per cage), and general health. Tabulated data are presented in the Ricerca Main Study Report in Appendix F. Animals were transferred to test diets on Day 0, and the first urine collection was performed on Day 1. Mice were exposed to test diets for a total period of 14 days. In-life monitoring data for test animals are summarized in Table 14.

Food Intake Cage 1 / Food Intake Cage 2

** Urine production based on pooled urine for four mice in Cage 1 / Cage 2

Body weight and food consumption data demonstrated that all dosing groups maintained weight gain and diet consumption similar to controls, indicating that the 5 percent diet composition achieved the goal of avoiding animal health concerns that might impact data interpretation. Urine data show a high degree of variability, ranging from 1.8 mL to 20 mL with most of the production between 4 and 6 mL per day. Overall health observations of test animals demonstrate that overt toxicity, as seen in animals exposed to target fragment extracts in the Pilot Study, was not present in the Main Study. Details of health monitoring data are presented in Appendix F.

Each day, 24-hour pooled urine samples were collected from each test group cage. Urine samples were frozen at -20oC until being shipped to AXYS Analytical following completion of the 14-day dosing period. Clinical inspection of mice indicated that exposure to PAHs in test diets did not result in observable

adverse effects to overall animal health. Mice were euthanized following completion of the study. All urine samples were delivered to AXYS Analytical, where samples were stored at -20oC until analysis.

5 URINE ANALYSES

The final selection of target PAHs was largely determined by the availability of standards for the analysis of PAH metabolites in urine. Based on the results of the analytical method development in the Pilot Study, target PAHs included BaP, benz(a)anthracene, and chrysene. Availability of laboratory standards and analytical performance data identified 3-OH-BaP, 9-OH-BaP, 3-OH-Chry, and 3-OH-BaA as the metabolites in mouse urine used to evaluate the relative bioavailability of PAHs.

Based on the precedents set by previous studies of PAH bioavailability, and the ease with which mouse urine can be collected and pooled from multiple animals, urinary metabolites were selected as the primary dosimetric. Analytical method development for measuring the concentrations PAH metabolites in urine was optimized by the addition of an antioxidant to the urine sample prior to extraction as described for the Pilot Study in Section 2.4. Urinary metabolites for PAHs typically represent less than 1 percent of the administered dose. The presence of the antioxidant prevented the oxidative loss of PAH metabolites, principally 3-OH-BaP. The results of PAH metabolite analyses in urine samples are summarized in Table 15, with data for two cages represented by cage 1/cage 2, and analytical reports are presented in Appendix H.

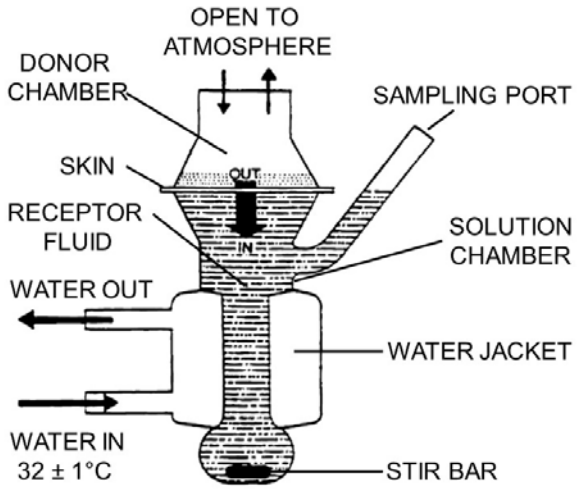
Bold values represent detected concentrations, "U" = not detected at the analytical reporting limit.

The method development for analysis of PAH metabolites in urine targeted a detection limit of 0.025 µg/L. Matrix interferences in mouse urine increased reporting limits by approximately an order of magnitude. The increased reporting limits, specifically for 3-OH-BaA and 3-OH-Chry, indicate that concentrations of individual PAHs must be above 5 mg/kg in soil to provide sufficient parent compound to detect these metabolites in urine. The analysis of BaP metabolites is more sensitive with consistent detections of metabolites in the urine for soil samples with a BaP concentration of approximately 0.5 mg/kg.

As previously stated, the Pilot Study for evaluating bioavailability of PAHs in soil from the Former Laredo AFB was conducted concurrent with investigations at the Former Foster AFB Skeet Range Site. Data from both studies demonstrate that the 3-hydroxy metabolite for benz(a)anthracene consistently is an order of magnitude below those reported for the hydroxy metabolites of BaP. Benz(a)anthracene, therefore, is a relatively poor compound for evaluating bioavailability by analysis of the 3-hydroxy metabolite.



The urinary results for PAH metabolites indicate that detectable levels of metabolites are present for chrysene at the 7-day time point. These data are used to develop site-specific RBAFs.

6 *IN VITRO* DERMAL PENETRATION TESTING

The dermal penetration testing proposed in the Investigation Plan (Pika-Malcolm Pirnie 2014) was based on an *in vitro* approach using Franz Cells and fresh-frozen human skin to determine the dermal penetration rate (steady-state flux = mass/skin area/time) of target PAHs. The *in vitro* method employed in this study has been demonstrated to be fully validated against *in vivo* methods and is routinely accepted by regulators (Federal Register 64 [110] 6/9/99; Organization for Economic Cooperation and Development [OECD] Guideline for the Testing of Chemicals: Method 428 [adapted 4/13/2004]). The study design, results, and data evaluation are presented below.

6.1 Dermal Penetration Testing

The *in vitro* dermal investigation uses Franz Diffusion Cells and fresh-frozen human split-skin samples to model the absorption of PAHs from clay target fragments and soil for systemic distribution and for local site of action in the skin itself. The Franz Cell has two chambers that can be separated by a membrane; in this case, excised human skin as illustrated in Figure 4.

from Roy et al. 1998

Figure 4 – Franz Diffusion Cell Schematic

Test articles can be loaded onto the surface of skin in the donor chamber. The solution chamber is filled with a receptor fluid that is in contact with systemic surface of the split-thickness skin sample. The receptor fluid is a saline solution with polyoxyethanol to act as a receiving agent for the lipophilic PAHs. The testing system allows for periodic collection of receptor fluid to monitor diffusion of PAHs across the skin from the test article in the donor chamber. The dermal penetration testing was performed by Charles River Laboratories. Details of the dermal investigation and results are presented in the project report presented in Appendix I.

Seven test groups were included in the dermal investigation with four test article groups and three control groups. The test groups included:

1. GS-1 Soil Test Article;
2. GS-2 Soil Test Article;
3. GS-3 Soil Test Article;
4. Pulverized Clay Target Fragments (sieved to 0.25 mm);
5. Clean Soil Test Article Spike with 25 ppm BaP;
6. Corn Oil Spiked with 1 mg/mL BaP; and
7. [C14]-Testosterone in 1% Ethanol Solution.

Soil test articles GS-4 and GS-5 were not included in the dermal absorption investigation due to analytical detection limitations and low concentrations of PAHs in these soil samples. Each test group has five Franz Cells, each with an excised fresh-frozen human skin sample from five different donors. The five donors were both male and female subjects ranging in ages from 23 to 65 years of age. Skin samples were obtained from a local hospital as the result of elective surgeries. All of the skin samples were obtained from either the abdominal area or breasts. Fresh-frozen human skin was selected for the testing because it is metabolically inactive while retaining the barrier characteristics of viable skin. The use of fresh-frozen skin, therefore, reduces the complexity of data evaluation.

Split-thickness skin samples in the donor chambers were loaded with 10 mg/cm^2 of test article, consistent with a monolayer for soil of 0.05 to 0.25 mm in particle size (USEPA 2004 Appendix C). Test articles were applied to skin for 24 hours with artificial sweat, then washed off. Collection of receptor fluid samples continued for an additional 48 hours for a total monitoring period of 72 hours for evaluation of PAH flux across the skin barrier. The data collection was terminated at 72 hours. Excised skin samples tend to break down after 48 hours, and the technical project team determined that 72 hours was the longest data collection period advisable. After 72 hours, skin samples were stripped five times with tape to remove the stratum corneum from each skin sample. Samples of stratum corneum (tape), dermis, and receptor fluid were extracted and analyzed for PAHs to determine the mass of PAHs in each medium.

Tape, skin, and receptor fluid were extracted and analyzed by high-performance liquid chromatography (HPLC) with fluorescence detection. Only six of the seven target PAHs are included in the dermal testing program. Indeno(1,23-cd)pyrene was not included in the suite of PAHs because of a co-elution interference. Because indeno(1,2,3-cd)pyrene is not a risk driver for the Former Foster AFB Skeet Range, its exclusion will not adversely affect the outcome of the dermal absorption investigation.

Evaluation of dermal absorption is based on the individual masses of PAHs in dermis at 72 hours and the sum of masses in receptor fluid samples collected at intermittent time points from 0 to 72 hours. Receptor fluid collection occurred at the following time points:

0 hour	24 hours
1 hour	36 hours
2 hours	48 hours
4 hours	60 hours
8 hours	72 hours

16 hours

The cumulative mass of PAHs representing systemic absorption are based on reported masses in the dermis at 72 hours and cumulative masses in receptor fluid for all time points.

6.2 Dermal Testing Results

The data produced by the analysis of skin and receptor fluid samples are masses of PAHs in each medium standardized to the area of the exposed skin (3.14 cm^2 for the Franz Cell). The absorbed dose is presented as the mass of PAHs in the dermis and receptor fluid samples in units of nanograms per square centimeter (ng/cm^2). The masses of PAHs in receptor fluid represent the summation of all detected concentrations in receptor fluid samples collected over the 72-hour period. Testing of the tape strips provides the concentrations of PAHs bound to the non-viable stratum corneum or adhered on the stratum corneum and unavailable for systemic absorption. The analytical results for PAHs in tape, dermis, and receptor fluid samples for PAHs are summarized in Table 16. Five of the six target PAHs are represented. Dibenz(a,h)anthracene was detected in only one of the samples collected for receptor fluids, skin, and tape samples near the reporting limit at 0.01 ng/cm^2. As a result, dibenzo(a,h)anthracene is not represented in Table 16.

GS-3	1.59	0.00	1.59	0.00	2.07	0.04
Target Frag	1.59	0.00	1.59	0.00	5.35	2.47

Doses of BaP, benz(a)anthracene, benzo(b)fluoranthene, and benzo(k)fluoranthene in/on the stratum corneum, dermis, and receptor fluid were closely related to their respective concentrations in the soil and fragment test articles. Concentrations of these PAHs in soil test articles are in the range of 3 to 5 ppm for GS-1, 25 to 30 ppm for GS-3, 200 to 300 ppm for GS-2, and 3,500 to 4,500 ppm for target fragments. The corresponding doses in/on stratum corneum, dermis, and receptor fluid correspond with these concentration ranges for the soil test articles, indicating a linear relationship between dermally absorbed doses of these four PAHs and soil concentrations. Chrysene was only detected in the receiving fluid near the reporting limit. The chromatographs for chrysene indicated peak interference, which may account for low responses.

Control samples included evaluations of dermal absorption of BaP from a variety of dosing media including 25 ppm BaP-spiked soil, 1,000 ppm BaP-spiked corn oil, and a radio-labeled testosterone sample. The concentration of the soil test article for GS-3 is similar to that of the BaP-spiked sample. The average absorbed dose in/on the stratum corneum is the same for both the BaP-spiked and the GS-3 test groups; however, the combined average absorbed doses in the dermis and receptor fluid are five times

higher in the BaP-spiked test group compared to the GS-3 soil test article group. The fragment test article exhibited the highest reported average absorbed doses, but these dose levels were consistent with the concentrations of PAHs in the fragment test articles. The corn oil exhibited a similar absorbed dose level as reported for the fragment test article based on the approximate 1,000 ppm concentration of the PAH in corn oil. Likely, the lipophilic BaP exhibited a relatively low partition rate from the corn oil to the skin.

The flux of PAHs across the skin barrier is the metric used to calculate the ABS.d factor. Flux introduces a time component into the dose and is expressed in units of nanograms per square centimeter per hour ($ng/cm^2/hr$). Table 17 provides a summary of flux rates and detection frequencies (lower limit of detection [LLOD]) for BaP, benz(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, and chrysene during the first 24 hours of the experiment.

Table 17 – Average Flux Rates for PAHs from Soil Test Articles, Fragments, and Controls

	24 Hour Average Flux Rate to Receptor Fluids									
	Benz(a) anthracene		Benzo(a) pyrene		Benzo(b) fluoranthene		Benzo(k) fluoranthene		Chrysene	
	ng/cm²/h	% > LLOQ	ng/cm²/h	% > LLOQ	ng/cm²/h	% > LLOQ	ng/cm²/h	% > LLOQ	ng/cm²/h	% > LLOQ
GS-1	0.003	3	0.003	3	0.036	7	0.001	0	0.00	0
GS-3	0.028	20	0.018	10	0.013	0	0.003	0	0.00	0
GS-2	0.1	33	0.062	27	0.1	13	0.021	17	0.031	3
Target Frag.	1.5	53	0.14	27	0.97	40	0.26	40	0.93	47
BaP Spike	-	-	0.56	40	-	-	-	-	-	-
BaP Oil	-	-	0.43	47	-	-	-	-	-	-

"LLOQ" = lower limit of quantification

As demonstrated in Table 17, the average flux estimates for PAHs associated with soil test article GS-1 during the first 24 hours of the experiment (i.e., before soils were removed from skins) are based on limited numbers of detected sample results with only 3 percent of samples having detectable concentrations for benzo(a)anthracene and benzo(a)pyrene, and only 7 percent detection frequency reported for benzo(b)fluoranthene. Both benzo(k)fluoranthene and chrysene exhibited no detectable sample results. As a result, the dermal absorption test group for soil test article GS-1 is likely to overestimate potential flux.

The large number of samples with non-detected concentrations of PAHs is largely related to the relatively long breakthrough period required to see PAHs on the skin penetrate through the skin into the receptor fluid. Consistent among all testing groups, PAHs are not present in the first five sample collection points from 0 to 8 hours. At 16 hours, PAHs were detected in the receiving fluid. In test articles with lower concentrations of PAHs, these compounds are generally not detected in the receptor fluid.

7 RBAF, ABS.D, SURROGATES, AND PCL CALCULATIONS

The data analysis for the Pilot and Main Studies includes calculation of RBAFs. No dermal penetration testing was performed as part of the Pilot Study; therefore, the ABS.d has only been calculated for the Main Study. In order to calculate the RBAFs, the ratio between doses of parent PAHs ingested by mice was compared to corresponding masses of PAH metabolites in urine for PAHs dosed in the soil matrix. This same comparison was made for the doses and masses of PAHs in the extract (solvent) matrix. The RBAF is a ratio of these two values and can be evaluated point-wise or using a regression approach. The ABS.d factor was calculated based on flux estimates using the dermal absorption doses presented in Section 6. Once calculated, the PAH-specific RBAF and ABS.d values are used to calculate site-specific PCLs. These calculations are summarized below.

7.1 RBAF Calculations

RBAFs were developed for target metabolites analyzed for in urine. RBAFs are calculated for BaP based on both 3-OH-BaP and 9-OH-BaP metabolites for both the 7-day and 14-day sample sets. Appendix J-1 provides a summary of the point-wise RBAF data for the Cage 1 animals, and Appendix J-2 summarizes the point-wise data for the Cage 2 animals. Because of the low concentrations of chrysene in sample GS-1 and the lack of detectible metabolite in the urine samples for this group, RBAFs could not be calculated for sample GS-1. RBAFs were calculated for chrysene based on a data set with four data points: GS-2 Day 7, GS-2 Day 14, GS-3 Day 7, and GS-3 Day 14. Because of a similar lack of detectible metabolites, the RBAF for benz(a)anthracene was based on two data points: GS-2 Day 7 and GS-2 Day14. The low concentrations of 3-OH-BaA and 3-OH-Chry metabolites are largely related to the relatively low fraction of ingested dose represented by these metabolites. Both benz(a)anthracene and chrysene are present in soil test articles at similar levels compared to BaP. Consistent with literature, 3-OH-BaP is a principal metabolite in urine for BaP. RBAFs based on 3-OH-BaP and 9-OH-BaP carry a high degree of confidence. The RBAFs from this evaluation will be applied to remaining target PAHs as surrogates based on similar chemical and physical parameters.

For each diet test group, the average dose of BaP was calculated from the concentration of BaP in the diet and the amount of diet consumed. The average daily dose was converted to units of µmole/d based on the chemical-specific molecular weight. FUE was calculated as:

$$FUE = \frac{(Mass\ of\ BaP\ metabolites\ in\ the\ 48-hour\ pooled\ urine\ sample\ at\ day\ X)}{(Mass\ of\ BaP\ consumed\ 48\ hours\ before\ urine\ collection\ on\ day\ X)}$$

The FUE calculations were performed individually for the animals dosed with the soil test article and for corresponding animals dosed with the extract test article diet. These were designated FUE_{soil} and $FUE_{extract}$.

The RBAF was defined as the ratio of the two FUE metrics.

$$RBAF = (FUE_{soil})/(FUE_{extract})$$

The RBAF calculations are summarized below. RBAFs are presented for soil/extract test groups for GS-1, GS-2, and G-3. The concentrations of individual PAHs in these samples range from approximately 5 ppm each to approximately 400 ppm. Soil test articles for GS-4 and GS-5 range from approximately 0.1 ppm to 0.7 ppm, with analytical results of metabolites largely at or below reporting limits. The RBAF calculation summaries presented below are based on the Day-14 results of data averaged between Cage 1 and Cage 2 for each test group.

Table 18 – RBAF Calculation Summary based on Day-14 Average Mass of PAH Orally Dosed and Average Mass of PAH Metabolites Excreted in Urine

	Dose (µmole/d)		Urine (µmole/d)		FUE_{Soil}	$FUE_{extract}$	RBAF
	Soil	Extract	Soil	Extract			
3OH-BaP							
GS-1	0.022	0.017	0.000041	0.00014	0.0019	0.0082	23
GS-2	0.96	0.53	0.0024	0.0092	0.0025	0.017	14
GS-3	0.14	0.12	0.00024	0.001	0.0017	0.0088	20
9OH-BaP							
GS-1	0.022	0.017	0.000013	0.000064	0.0006	0.0037	16
GS-2	0.96	0.53	0.00075	0.0028	0.00078	0.0053	15
GS-3	0.14	0.12	0.000073	0.00036	0.00047	0.003	16
3OH-Chry							
GS-2	1.03	0.60	0.00094	0.0018	0.00091	0.003	30
GS-3	0.15	0.12	0.00017	0.00057	0.0012	0.0047	25
3OH-BaA							
GS-2	0.92	0.55	0.00007	0.00019	0.000076	0.00034	23

The Day-14 RBAFs for BaP, based on 3-OH-BaP and 9-OH-BaP metabolites, range from 0.14 to 0.23. These results are lower than those reported in the Pilot Study ranging from 0.28 to 0.34. The Pilot Study used estimates of urine volume, which has a large impact on the calculation of RBAFs; therefore, the Main Study RBAFs, based on measured urine volumes, are more accurate than Pilot Study RBAFs. The RBAFs for chrysene, based on the Day-14 urine samples, range from 0.25 to 0.3. This result is also below the Pilot Study range of 0.42 to 0.57. Finally, the Day-14 RBAF for benz(a)anthracene, limited to one measurement based on the GS-2 test group, is 0.23. This RBAF is below the range reported in the pilot study of 0.35 to 0.37. As presented in Appendix D, the Day-7 RBAF for pulverized target fragments was 0.28 for 3-OH-BaP and 0.27 for 9-OH-BaP.

An alternative approach to deriving RBAFs relies on linear regression (Casteel et al. 2001, 2003). In this approach, urinary PAH metabolite excretion rates are regressed against daily PAH intake rates, both for mice treated daily with soil amended and soil extract amended diets. The resulting slopes for the treatments provide estimates of the FUE (additional details are provided in Appendix K), and an RBAF can be estimated as the ratio of the FUEs from the soil and soil-extract amended diets. A 95% upper confidence limit (UCL) on the RBAF is then calculated using Monte Carlo simulation that incorporates all of the available data from the Foster Main Bioavailability Study. The regression analyses demonstrate that the excretion rates are directly proportional to dose rates, and that the RBAF for BaP is less than or equal to 20 percent (refer to Appendix K). The 95% UCL on the RBAF is equivalent to the point estimate RBAF proposed here, and this value of 20 percent is ultimately used as the RBAF for calculating PCLs. Together, the PAH Bioavailability Studies conservatively support the application of RBAFs as follows:

- BaP – 20 percent
- Benz(a)anthracene – 23 percent
- Chrysene – 28 percent

It is concluded that the RBAF of 20 percent for BaP is a conservative estimate based on the regression analyses detailed in Appendix K, all of which yield RBAFs less than or equal to 20 percent.

7.2 ABS.d Calculation

Dermal penetration testing for PAHs in target fragments and soil from the Site demonstrated a decreased dermal absorption of PAHs in the clay target matrix compared to PAHs dosed in either spiked soil or corn oil. The data produced in the dermal penetration testing are presented in terms of absorbed dose in units of ng/cm^2. Dermal absorption is based on flux, which introduces a temporal component to the calculation (ng/cm^2/hr). The calculation of ABS.d is based on the following:

1. Calculation of Experimental Absorption Factor (ABSExp; picograms per square centimeter [pg/cm^2])

$$ABS_{Exp} = (\mathrm{FR_{RF}} \times \mathrm{ET}) + \mathrm{ABSs}$$

where:

FR$_{RF}$ = Flux Rate to Receptor Fluid (pg/cm^2/hr)

ET = Experiment Time (hr)

ABSs = Skin Absorption (pg/cm^2)

2. Calculation of Adjusted Absorption Factor (ABS$_{Adj}$; pg/cm^2)

$$ABS_{Adj} = ABS_{Exp} \times \left(\frac{\mathrm{FSLR}}{\mathrm{ESLR}}\right)$$

where:

FSLR = Field Soil Loading Rate (0.2 mg/cm^2)

ESLR = Experimental Soil Loading Rate at Monolayer (10 mg/cm^2)

3. Calculation of ABS.d (unitless)

$$\text{ABS.d} = \frac{ABS_{Adj}}{(\text{C} \times \text{FSLR} \times \text{CF})}$$

where:

C = Concentration of PAH in Test Article (ng/mg)

CF = Conversion Factor (pg/ng)

The ABS_{Adj} calculation corrects the absorption fraction to account for the application of the 10 mg/cm^2 monolayer in the dermal penetration testing protocol. Just as the RBAF calculations were dominated by a number of factors including concentrations of PAHs and PAH metabolites in urine, food ingestion rates, and daily urine volumes, ABS.d is heavily influenced by the reported soil concentration. As discussed in Section 3, ALS analytical results for soil test articles had difficulty achieving the project-specific target RSD of 20 percent, which, in theory, could have been due to sample heterogeneity or imprecision in the PAH analytical method. Given that diets were prepared, analyzed, and demonstrated to meet the RSD requirements, the high RSDs in the analytical results for the soil test articles were not due to heterogeneity of the soil samples; they were due to imprecision of the analytical method. These analytical uncertainties did not impact interpretation of oral bioavailability data because the oral RBAFs are all based on direct measurements of PAH concentrations in diet. To minimize uncertainties in the ABS.d calculations, the ALS soil concentration data were not used. Instead, the ABS.d calculation is based on concentrations of PAHs in the 5% diets times 20 as a more representative PAH concentration in soil due to much lower RSDs in the analytical database when AXYS performed the analysis.

Table 19 – ABS.d Calculation Summary Based on Cumulative 72-Hour Receptor Fluid Results and Dermis Concentrations at 72-Hours

	Average Flux Rate to Receptor Fluid		Average ABS.d Based on Receptor Fluid	Average ABS.d Based on Receptor Fluid and Dermis
	ng/cm^2/h	% > LLOQ	%	%
Benzo(a)pyrene				
GS-1	0.011	10	0.35	1.3
GS-3	0.03	38	0.16	0.83

GS-2	0.003	0	0.02	0.15
Target Frag	0.0	0	0.00	0.01

“LLOQ” = lower limit of quantification

The calculated ABS.ds for use in deriving PCLs were determined based on flux rates over 72 hours and do not include the PAHs retained in or on the non-viable stratum corneum. Flux rates were calculated over 72 hours to account for the long lag time observed for PAHs to penetrate through skin membranes to the receptor fluid (i.e., typically greater than 8 hours). The PAHs bound in the stratum corneum or on the surface of the stratum corneum are assumed to be unavailable for penetration to dermis and systemic compartments because the skin sloughs frequently. This assumption is supported by the data presented in Table 16. Concentrations of BaP in the GS-3 and BaP Spike samples were closely related at 28 ppm and 25 ppm, respectively. The corresponding doses of BaP in/on the stratum corneum for GS-3 and the BaP Spike samples were also closely related at 2.31 ng/cm^2 and 3.15 ng/cm^2, respectively. The dermis doses and receptor fluid doses, however, were very different for GS-3 (BaP in soil test article at approximately 28 ppm) and BaP Spike (reagent grade BaP spiked in clean soil at 25 ppm). The dermis dose for GS-3 was 1.74 ng/cm^2 compared to 13 ng/cm^2 for BaP Spike, and the receptor fluid dose for GS-3 was 2.6 ng/cm^2 compared to 8.35 ng/cm^2 for BaP Spike. The dose of BaP penetrating dermis and systemic compartments in the BaP Spike sample was five times greater than the dose reported for GS-3. Because the stratum corneum exhibited similar doses in these two samples 48 hours after the termination of the exposure, regardless of the dose of PAHs moving through the dermis to the receptor fluid, the residual dose from the tape strip samples is unavailable for absorption. However, PAHs remaining in skin samples after tape-stripping are potentially available for systemic absorption. Thus, ABS.d was calculated using the dose of PAH remaining in skin and in receptor fluid after the 72-hour experiment, as shown in Table 20.

Evaluation of dermal penetration is focused on results for soil test articles GS-2 and GS-3. Concentrations of PAHs in soil test article GS-1 were too low to see reportable concentrations of PAHs in the receptor fluid as demonstrated in Table 20. The percentages of receptor fluid samples with detectable concentrations of PAHs ranged from 0 to 18 percent. The high frequency of non-detected results for the GS-1 soil test article means that the calculated ABS.d values are based on the sample-specific reporting limits rather than mass of PAH penetrating the dermal barrier. For these reasons, ABS.d values are based on the results for the GS-2 and GS-3 soil test articles.

As mentioned previously, the calculation of ABS.d is sensitive to the reported concentrations of PAHs in soil. The calculations of ABS.d presented in Table 19 are based on the back-calculation of PAH concentrations in soil using AXYS data for PAH concentrations in diet divided by 5 percent, accounting for the mass of soil in the diet preparation. The only data available for the concentrations of PAHs in soil test articles are the initial analyses prepared by ALS. The PAH concentrations reported by ALS Environmental were generally 40 percent below the back-calculated values using diet concentrations reported by AXYS. Comparisons of target concentrations in diet for PAHs in soil test articles and extracts indicated that the soil data provided by ALS Environmental for test articles were systematically biased low. A sensitivity analysis was performed by calculating ASB.d for BaP using concentrations in soil test articles GS-2 and GS-3 based on ALS analytical results and back-calculated concentrations from AXYS results for diets. Table 20 provides a summary of the respective soil BaP concentrations and corresponding ABS.d for BaP using the two approaches.

Table 20 – Comparison of Effects of Soil Concentrations of Benzo(a)pyrene on ABS.d Calculation

	ALS Soil Test Article Data		AXYS Diet Data	
	Conc. ppm	ABS.d (%)	Conc. ppm	ABS.d (%)
GS-2	183	1.22	383	0.58
GS-3	28	1.51	51	0.83

The relative changes in the ABS.d values are proportional to the relative differences in the soil concentrations used in the calculations. The analytical data presented by AXYS Analytical carry a higher degree of confidence because their analytical results confirmed dose preparations by Ricerca. The recommended ABS.d values for the target PAHs, therefore, are based on the average of the GS-2 and GS-3 ABS.d values for the data set using the back-calculated soil concentrations from the AXYS diet analyses as follows:

- Benz(a)pyrene – 0.007
- Benz(a)anthracene – 0.007
- Benzo(b)fluoranthene – 0.011
- Benzo(k)fluoranthene – 0.0035
- Chrysene – 0.0027
- Dibenz(a,h)anthracene – 0.0057
- Indeno(1,2,3-cd)pyrene – 0.011 (based on benzo(b)fluoranthene)

7.3 Surrogate RBAFs for PAHs

GI absorption of carcinogenic PAHs is principally influenced by the lipophilic nature of these compounds, where the desorption of PAHs from the source materials and solvation by GI fluids (including bile salts) are important prerequisites for intestinal absorption and oral bioavailability (Ruby et al. 2016). GI absorption of PAHs is closely related to mechanisms for digestion of oils and fats including lipolysis and bile production (Rahman et al. 1986). Absorption of carcinogenic PAHs, along with fats and oils, occurs in the small intestines through the formation and uptake of micelles in the presence of bile salts. Multiple investigations of fed and fasted states in both *in vitro* and *in vivo* models demonstrate enhancement of PAH solubility by the presence of mixed intestinal lipids under fed conditions.

Research performed on the uptake of dioxins in food animals has concluded that uptake of dioxins is related to soil characteristics and chemical properties, principally lipophilicity, water solubility, molecular weight, and chlorination (McLachlan 1997 and Roeder et al. 1998). Laurent et al. (2002) performed similar research on PAHs, as well as dioxins, evaluating the portal absorption of radiolabeled 2,3,7,8-tetrachlorodibenzodioxin (TCDD), BaP, and phenanthrene. The authors concluded that phenanthrene, with a three-ring structure and log octanol-water partitioning coefficient (Kow) of 4.5, has a different mechanism of absorption compared with the more lipophilic BaP and TCDD. The authors show that, for

lipophilic compounds such as TCDD and BaP, Kow and water solubility are important factors in GI absorption with lower rates of absorption of these radiolabeled compounds from milk as Kow increases.

Where the lipophilic compounds are associated with environmental media like soil, or in a solid state such as in a target fragment or coal tar pitch, higher Kow would also indicate a greater competition for chemicals such as high-molecular-weight PAHs in the solid phase compared to the aqueous phase, where inclusion into micelles would occur.

Table 21 provides a summary of the chemical and physical properties of the seven PAHs of concern at the former Foster AFB SGR.

Table 21 - Chemical and Physical Properties of PAHs[1]

COC	Number Aromatic Rings	Molecular Weight (g/mole)	Log Kow	Water Solubility (µg/L)
Benz(a)anthracene	4	228	5.76	9.4
Chrysene	4	228	5.81	2.0
Benzo(b)fluoranthene	5	252	5.78	1.5
Benzo(k)fluoranthene	5	252	6.11	0.8
Benzo(a)pyrene	5	252	6.13	1.62
Indeno(1,2,3-cd)pyrene	6	276	6.7	0.19
Dibenz(a,h)anthracene	5	278	6.75	2.49

1. Data are from USEPA Regional Screening Level (RSL) tables (2017a)

Based on physical structure (number of aromatic rings and molecular weight) and chemical properties (log K_{ow} and water solubility), BaP is an appropriate surrogate for benzo(b)fluoranthene, benzo(k)fluoranthene, indeno(1,2,3-cd)pyrene, and dibenz(a,h)anthracene. BaP has the same molecular weight as benzo(b)fluoranthene and benzo(k)fluoranthene. BaP has a five-ring structure, as do benzo(b)fluoranthene, benzo(k)fluoranthene, and dibenz(a,h)anthracene. Indeno(1,2,3-cd)pyrene has a six-ring structure. Benz(a)anthracene and chrysene have four-ring structures. The molecular weights of dibenz(a,h)anthracene (278 g/mole) and indeno(1,2,3-cd)pyrene (276 g/mole) are higher than BaP (252 g/mole), but much higher than the molecular weights of benz(a)anthracene (228 g/mole) and chrysene (228 g/mole). The log K_{ow} and solubility values for benzo(b)fluoranthene, benzo(k)fluoranthene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene are also quite similar to those of BaP.

The influence of chemical and physical characteristics of the PAHs on absorption through biological membranes is confirmed by the RBA data presented in the Laredo Pilot Study and the Foster PAH Bioavailability Study. In all cases, RBAFs calculated for detectable concentrations of PAH metabolites for benz(a)anthracene and chrysene are higher than the calculated RBAFs for 3-OH-BaP and 9-OH-BaP. These data are consistent with the results reported by Laurent et al. (2002), where lower molecular weight PAHs that are more soluble would be expected to exhibit higher absorption rates.

There is much literature published on the toxicity and carcinogenicity of PAHs in humans. The PAHs subject to this investigation are limited to the seven PAHs defined currently by the USEPA as potentially carcinogenic. BaP is the most studied of the PAHs and, therefore, serves as the basis for evaluation of cancer potency for all potentially carcinogenic PAHs. BaP, benz(a)anthracene, and chrysene were the subjects of the bioavailability studies at the Former Laredo AFB and Former Foster AFB sites. BaP has been recommended as a surrogate for benzo(b)fluoranthene, benzo(k)fluoranthene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene based on similar structure, water solubility, log K_{ow}, and molecular weight. The recent draft review of relative potency factors (RPFs) for carcinogenic PAHs published by the USEPA provides updates the assumptions concerning the carcinogenicity of these four PAHs compared to BaP (USEPA 2010). Table 22 provides a summary of the current (USEPA 2017b) and proposed RPFs for the four PAHs, which provides the basis of comparison of relative toxicity (carcinogenicity).

Table 22 – Relative Potency Factors for Select PAHs

PAH	Current RPF	Proposed RPF
Benzo(b)fluoranthene	0.1	0.8
Benzo(k)fluoranthene	0.01	0.03
Dibenz(a,h)anthracene	1	10
Indeno(1,2,3-cd)pyrene	0.1	0.07

Comparison of the current and proposed RPFs shows that benzo(b)fluoranthene, benzo(k)fluoranthene, and indeno(1,2,3-cd)pyrene are less potent carcinogens compared to BaP, while dibenzo(a,h)anthracene has similar or greater potency compared to BaP. Benzo(k)fluoranthene and indeno(1,2,3-cd)pyrene exhibit relative potencies between 10 and 100 times lower than BaP; therefore, the use of BaP as a surrogate for these two PAHs is unlikely to introduce a large uncertainty into conclusions of the overall risk assessment for the former Foster AFB Site.

Cancer potencies of benzo(b)fluoranthene and dibenz(a,h)anthracene are comparable to or greater than that of BaP. The relative toxicities of benzo(b)fluoranthene and dibenz(a,h)anthracene compared to BaP are also related to their relative concentrations in the coal tar pitch/limestone matrix of the clay target fragments. Table 23 presents a summary of PAH concentrations in samples of clay target fragments from the former Foster AFB Site.

Table 23 – PAH Concentrations (mg/kg) in Clay Target Fragment Samples from the Former Foster AFB Bioavailability Study

COC	Foster Main Study	Foster Pilot Study
Benzo(a)pyrene	4,430	1,233
Benz(a)anthracene	2,850	1,067
Benzo(b)fluoranthene	3,930	1,533
Benzo(k)fluoranthene	1,960	395
Chrysene	3,720	1,200
Dibenz(a,h)anthracene	696	203
Indeno(1,2,3-cd)pyrene	2,810	946

The concentrations of dibenz(a,h)anthracene in clay target fragments are consistently less than half the concentrations of BaP. Although dibenz(a,h)anthracene is potentially a more potent carcinogen, the lower concentrations of dibenz(a,h)anthracene counteract its similar or potentially higher cancer potency compared to BaP. Benzo(b)fluoranthene is present at slightly lower concentrations compared to BaP in target fragments and exhibits a lower cancer potency than BaP. The application of BaP as a surrogate for estimating the relative bioavailability of benzo(b)fluoranthene and dibenz(a,h)anthracene in clay target fragments introduces a moderate risk of either underestimating or overestimating potential risk from incidental ingestion of soil from the former Foster AFB Site. As with all extrapolations in the environmental field, there is unavoidable uncertainty with the present state of knowledge.

7.4 PCL Calculation

PCLs were calculated based on the equations, factors, and assumptions presented in the TRRP rule (30 Texas Administrative Code [TAC] §350, Subchapter D). The critical PCLs for PAHs in soil at the former Foster AFB are based on direct contact by commercial/industrial receptors, which are evaluated using the $^{Tot}Soil_{Comb}$ PCL. The $^{Tot}Soil_{Comb}$ PCL calculations for PAHs have three Risk-Based Exposure Limit (RBEL) pathways including:

1. Dermal contact with COCs ($^{Soil}RBEL_{Derm\text{-}c}$) as described in 30 TAC §350.74(c).
    a. Carcinogenic

$$^{Soil}RBEL_{Derm-c} = \frac{(RL \times BW.A \times ATc \times 365\ days/yr)}{(SF \times MF \times 10^{-6}\ kg/mg \times ED.w \times EF.w \times SA.w \times AF.w \times ABS.d)}$$

where:

RL – Risk Level - 10^{-5}

BW.A – Body Weight – adult - 70 kg

ATc – Averaging Time – carcinogens - 70 years

SF – Cancer Potency Slope Factor - chemical specific $(mg/kg\text{-}day)^{-1}$

MF – Modifying Factor – 1 for PAHs

ED.w – Exposure Duration – worker - 25 years

EF.w – Exposure Frequency – worker – 250 days

SA.w – Skin Surface Area – worker – 2,500 cm^2

AF.w – Soil-to-Skin Adherence Factor – worker – 0.2 mg/cm^2-event

ABS.d – Dermal Absorption Factor – chemical-specific

b. Noncarcinogenic

$$^{Soil}RBEL_{Derm-nc} = \frac{(HQ \times RfD_d \times BW.A \times AT.w \times 365\ days/yr)}{(10^{-6}\ kg/mg \times ED.w \times EF.w \times SA.w \times AF.w \times ABS.d)}$$

where:

HQ – Hazard Quotient – 1 (unitless)

RfDd – Dermal Reference Dose (mg/kg-day) – chemical-specific

AT.w – Averaging Time – noncarcinogens (yr) – 25 years

2. Ingestion of COCs in soil (SoilRBELIng-c) as described in 30 TAC §350.74(d).

a. Carcinogenic

$$^{Soil}RBEL_{Ing-c} = \frac{(RL \times BW.A \times ATc \times 365\ days/yr)}{(SF \times MF \times 10^{-6}\ kg/mg \times ED.w \times EF.w \times IRsoil.w \times RBAF)}$$

where:

IRsoil.w - Soil Ingestion Rate – worker – 100 mg/day

RBAF - Relative Bioavailability Factor – chemical-specific (unitless)

b. Noncarcinogenic

$$^{Soil}RBEL_{Ing-nc} = \frac{(HQ \times BW.A \times RfD_o \times AT.w \times 365\ days/yr)}{(10^{-6}\ kg/mg \times ED.w \times EF.w \times IRsoil.w \times RBAF)}$$

where:

RfDo – Oral Reference Dose (mg/kg-day) – chemical-specific

3. Inhalation of COCs from air ($^{Air}RBEL_{Inh\text{-}VP}$) as described in 30 TAC §350.74(d).

   a. Carcinogenic

$$^{Air}RBEL_{Inh-c} = \frac{(RL \times ATc \times 365\ days/yr)}{(URF \times 10^3\ \mu g/mg \times ED.w \times EF.w)}$$

where:

URF – Unit Risk Factor – chemical-specific (µg/m^3)

   b. Noncarcinogenic

$$^{Air}RBEL_{Inh-nc} = \frac{(RfC \times HQ \times AT.w \times 365\ days/yr)}{(ED.w \times EF.w)}$$

where:

RfC – Reference Concentration (mg/m^3) – chemical-specific

   c. The PCL for the inhalation of COC vapors or adsorbed to fugitive dusts is calculated individually for carcinogenic and noncarcinogenic endpoints based on the PCL calculations described in 30 TAC §350.75(b)(1).

$$^{Air}Soil_{Inh-VP} = \frac{^{Air}RBEL_{Inh-VP}}{VF_{SS} + PEF}$$

where:

VF_{SS} – Volatilization Factor – chemical-specific $\frac{mg/m^3-air}{mg/kg-soil}$

PEF – Particulate Emission Factor – 2.09 x 10^{-9} $\frac{mg/m^3-air}{mg/kg-soil}$

The RBELs can be re-calculated using site-specific RBAFs as described in 30 TAC §350.74(j)(1)(C) and ABS.d as described in 30 TAC §350.74(j)(1)(B). Ingestion RBEL and dermal contact RBEL are equivalent to their respective PCLs. The $^{Tot}Soil_{Comb}$ PCL is calculated individually for the carcinogenic and noncarcinogenic endpoints using the equation presented in 30 TAC §350.75(b)(1), and the lowest of the two resulting values is selected as the final $^{Tot}Soil_{comb}$ PCL (see Appendix J-3 for additional details):

$$^{Tot}Soil_{Comb} = \frac{1}{\left(\frac{1}{^{Soil}RBEL_{Ing}}\right) + \left(\frac{1}{^{Soil}RBEL_{Derm}}\right) + \left(\frac{1}{^{Air}Soil_{Inh-VP}}\right)}$$

Based on the equations, factors, and assumptions presented in the TRRP rule, site-specific PCLs can be calculated by adjusting the RBAFs for PAHs as previously described and ABS.d values to determine the potential impact of applying site-specific dermal absorption values. A summary of potential site-specific $^{Tot}Soil_{Comb}$ PCLs for PAHs at the Former Foster AFB is presented below.

Table 24 – Summary of Tier 2 $^{Tot}Soil_{Comb}$ PCLs for PAHs at the Former Foster AFB (mg/kg)

COC	Slope Factor $(mg/kg\text{-}day)^{-1}$	IUR $(mg/m^3)^{-1}$	RfDo (mg/kg-day)	RfC (mg/m^3)	RBAF (unitless)	ABS.d (unitless)	$^{Tot}Soil_{Comb}$ (mg/kg)
Benz(a)anthracene	0.1	0.00006	--	--	0.23	0.007	880[a]
Benzo(a)pyrene	1	0.0006	0.0003	0.000002	0.2	0.007	43[b]
Benzo(b)fluoranthene	0.1	0.00006	--	--	0.2	0.011	980[a]
Benzo(k)fluoranthene	0.01	0.000006	--	--	0.2	0.0035	12,000[a]
Dibenz(a,h)anthracene	1	0.0006	--	--	0.2	0.0057	120[a]
Indeno(1,2,3-cd)pyrene	0.1	0.0006	--	--	0.2	0.011	1,100[a]

a. Based on carcinogenic endpoint
b. Based on noncarcinogenic endpoint
c. Chrysene is not a COC at the former Foster AFB.

8 CONCLUSIONS

Based on the results of the PAH Bioavailability Study for the former Foster AFB Site, the following conclusions have been made:

- Reproducible soil test articles can be reliably prepared from bulk soil samples through soil sample sieving and mixing procedures developed in these studies.
- Diets prepared from soil test articles and extracts can be reliably prepared, controlling the dose of environmental contaminants delivered to test animals for the purpose of evaluating bioavailability using procedures in this study.
- An analytical methodology to quantify the concentrations of urinary PAH metabolites has sufficient sensitivity to evaluate oral bioavailability soil samples impacted with PAHs down to approximately 1 mg/kg based on BaP concentrations and 10 mg/kg for chrysene and benz(a)anthracene concentrations.
- RBAFs based on FUE calculations have provided consistent results between samples and studies in the literature.
- Conservative RBAFs for PAHs at the former Foster AFB Site are: 1) 0.2 for BaP, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene; 2) 0.23 for benz(a)anthracene; and 3) 0.28 for chrysene.
- Dermal penetration testing carries sufficient sensitivity to evaluate ABS.d from soil samples impacted with PAHs down to approximately 10 mg/kg (below 10 mg/kg, LLODs will dictate ABS.d with ABS.ds increasing as concentrations of PAH further decrease).
- PCLs for BaP increase by approximately a factor of 2 above the published Tier 1 PCLs based solely on application of site-specific RBAFs.
- PCLs for BaP increase as much as by a factor of 2.5 times above published Tier 1 PCLs based on both site-specific RBAFs and ABS.d values
- Recommended Tier 2 PCLs for Commercial/Industrial land use at the former Foster AFB Skeet Range Site are as follows:
    - Benzo(a)pyrene – 43 mg/kg
    - Benz(a)anthracene – 880 mg/kg
    - Benzo(b)fluoranthene – 980 mg/kg
    - Benzo(k)fluoranthene – 12,000 mg/kg
    - Dibenz(a,h)anthracene – 120 mg/kg
    - Indeno(1,2,3-cd)pyrene – 1,100 mg/kg

APPENDIX A

Pilot Study ALS Environmental Soil and Diet Analytical Reports

01-Mar-2013

Glenn Hoeger
ARCADIS U.S., Inc.
One South Church Avenue, Suite 1120
Tucson, AZ 85701

Tel: (520) 629-8282
Fax: (520) 620-6476

Re: Former Foster AFB Skeet Range Work Order: **1302027**

Dear Glenn,

ALS Environmental received 16 samples on 25-Jan-2013 09:55 AM for the analyses presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

The total number of pages in this report is 26.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Bethany McDaniel

Electronically approved by: Kristin M Brown

QUALIFIERS, ACRONYMS, UNITS

Qualifier	Description
*	Value exceeds Regulatory Limit
a	Not accredited
B	Analyte detected in the associated Method Blank above the Reporting Limit
E	Value above quantitation range
H	Analyzed outside of Holding Time
J	Analyte detected below quantitation limit
M	Manually integrated, see raw data for justification
n	Not offered for accreditation
ND	Not Detected at the Reporting Limit
O	Sample amount is > 4 times amount spiked
P	Dual Column results percent difference > 40%
R	RPD above laboratory control limit
S	Spike Recovery outside laboratory control limits
U	Analyzed but not detected above the MDL

Acronym	Description
DCS	Detectability Check Study
DUP	Method Duplicate
LCS	Laboratory Control Sample
LCSD	Laboratory Control Sample Duplicate
MBLK	Method Blank
MDL	Method Detection Limit
MQL	Method Quantitation Limit
MS	Matrix Spike
MSD	Matrix Spike Duplicate
PDS	Post Digestion Spike
PQL	Practical Quantitation Limit
SD	Serial Dilution
SDL	Sample Detection Limit
TRRP	Texas Risk Reduction Program

Units Reported	Description
µg/Kg	Micrograms per Kilogram

Re: Foster Pilot Study Work Order: **1304231**

Dear Glenn,

ALS Environmental received 5 samples on 25-Jan-2013 09:55 AM for the analyses presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

The total number of pages in this report is 16.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Bethany McDaniel

QUALIFIERS, ACRONYMS, UNITS

Qualifier	Description
*	Value exceeds Regulatory Limit
a	Not accredited
B	Analyte detected in the associated Method Blank above the Reporting Limit
E	Value above quantitation range
H	Analyzed outside of Holding Time
J	Analyte detected below quantitation limit
M	Manually integrated, see raw data for justification
n	Not offered for accreditation
ND	Not Detected at the Reporting Limit
O	Sample amount is > 4 times amount spiked
P	Dual Column results percent difference > 40%
R	RPD above laboratory control limit
S	Spike Recovery outside laboratory control limits
U	Analyzed but not detected above the MDL

Acronym	Description
DCS	Detectability Check Study
DUP	Method Duplicate
LCS	Laboratory Control Sample
LCSD	Laboratory Control Sample Duplicate
MBLK	Method Blank
MDL	Method Detection Limit
MQL	Method Quantitation Limit
MS	Matrix Spike
MSD	Matrix Spike Duplicate
PDS	Post Digestion Spike
PQL	Practical Quantitation Limit
SD	Serial Dilution
SDL	Sample Detection Limit
TRRP	Texas Risk Reduction Program

Units Reported	Description
µg/Kg	Micrograms per Kilogram
wt%-dry

Re: Foster Pilot Study Work Order: **1304777**

Dear Glenn,

ALS Environmental received 13 samples on 25-Jan-2013 09:55 AM for the analyses presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

The total number of pages in this report is 24.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Bethany McDaniel

Electronically approved by: Jumoke M. Lawal

QUALIFIERS, ACRONYMS, UNITS

Qualifier	Description
*	Value exceeds Regulatory Limit
a	Not accredited
B	Analyte detected in the associated Method Blank above the Reporting Limit
E	Value above quantitation range
H	Analyzed outside of Holding Time
J	Analyte detected below quantitation limit
M	Manually integrated, see raw data for justification
n	Not offered for accreditation
ND	Not Detected at the Reporting Limit
O	Sample amount is > 4 times amount spiked
P	Dual Column results percent difference > 40%
R	RPD above laboratory control limit
S	Spike Recovery outside laboratory control limits
U	Analyzed but not detected above the MDL

Acronym	Description
DCS	Detectability Check Study
DUP	Method Duplicate
LCS	Laboratory Control Sample
LCSD	Laboratory Control Sample Duplicate
MBLK	Method Blank
MDL	Method Detection Limit
MQL	Method Quantitation Limit
MS	Matrix Spike
MSD	Matrix Spike Duplicate
PDS	Post Digestion Spike
PQL	Practical Quantitation Limit
SD	Serial Dilution
SDL	Sample Detection Limit
TRRP	Texas Risk Reduction Program

Units Reported	Description
µg/Kg	Micrograms per Kilogram
µg/L	Micrograms per Liter
Various

Re: Foster Pilot Study Work Order: **14030085**

Dear Glenn,

ALS Environmental received 22 samples on 28-Feb-2014 09:20 AM for the analyses presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

The total number of pages in this report is 25.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Bethany McDaniel

Electronically approved by: Jumoke M. Lawal

Case Narrative

Batch 77275, PAHs by Method SW8270, Sample "45-Middle": Surrogate recovery, 4-Terphenyl-d14, was above the control limits.

Batch 77275, PAHs by Method SW8270, Insufficient sample to perform MS/MSD. LCS/LCSD provided as batch quality control.

Batch 77275, PAHs by Method SW8270: Low area counts for all internal standards in all samples except "41-Bottom" and "45-Middle". Sample re-ran with simlilar results.

Batch 77275, PAHs by Method SW8270: Sample "41-Bottom" had low area counts for all internal standards except Chrysene-d12.

Batch 77275, PAHs by Method SW8270: Sample "45-Middle" had low area counts for all internal standards except Phenanthrene-d12.

Summary

The objectives of this study were to determine palatability of soil and extract diet mixtures and provide urine samples to test analytical methods for analyzing the presence of select metabolites of polycyclic aromatic hydrocarbons (PAHs) in urine.

Methods

Thirty-two female B6C3F1 mice, 4 per group, were assigned to 8 groups as shown as shown in the table below. Each group was housed together in a metabolism cage to allow for daily collection of pooled urine. Animals were dosed as a dietary admixture with test articles mixed into their NIH-31 meal diet at the levels shown in the table below. The dose levels in ppm, shown in the table below, are calculated levels based on the measured benzo(a)pyrene (B[a]P) in each respective lot of test article used. Animals received these diets for up to 14 consecutive days. Animals were observed for viability twice daily throughout the study and cageside clinical observations were performed daily. Individual animal body weights were taken daily during the dosing period and food consumption per cage (divided by four to obtain an average food consumption per animal) was measured daily during the dosing period. The first day of administration was designated as Day 1 of the study. All animals except Group 8 were terminated without necropsy on Day 15. Group 8 animals were terminated moribund on Day 10 due to failing health of test subjects in this dosing group.

Group Assignment and Dose Levels

Dose Group	Number of Animals (Female)	Test Article	Test Article Lot Number	Dose Level	
1	4	Sieved soil to 250 µM negative control	1304777-07A	10% (w/w) of diet	
2	4	B(a)P Positive control	SLBF45S3V	25 ppm B(a)P	
3	4	Sieved Soil	1304777-01A	5% (w/w) of diet	12.5 ppm B(a)P
4	4	Sieved Soil	1304777-01A	10% (w/w) of diet	25 ppm B(a)P
5	4	Sieved Soil	1304777-01A	20% (w/w) of diet	50 ppm B(a)P
6	4	Extract of Sieved Soil	1304777-04A	B(a)P ppm Equivalent of Group 4 (10% of diet)	25 ppm B(a)P
7	4	Pulverized Clay Target Fragment	1304777-08A	10% of diet	110 ppm B(a)P
8	4	Extract of Pulverized Clay	1304777-11A	B(a)P ppm Equivalent of Group 7 (10% of diet)	110 ppm B(a)P

*Percentage shown is percent soil in the diet; ppm shown for Groups 3, 4, and 5 is calculated ppm of Benzo(a)pyrene based on the B(a)P level in soil sample 1304777-01A supplied by ALS Environmental; ppm shown for Group 6 is calculated ppm of Benzo(a)pyrene based on the B(a)P level in soil extract sample 1304777-04A supplied by ALS Environmental; ppm shown for Group 7 is calculated ppm of Benzo(a)pyrene based on the B(a)P level in fragment sample 1304777-08A supplied by ALS Environmental; ppm shown for Group 8 is calculated ppm of Benzo(a)pyrene based on the B(a)P level in fragment extract sample 1304777-11A supplied by ALS Environmental.

Results

All Group 8 animals were sacrificed moribund on Day 10. Gross necropsies performed on these Group 8 animals revealed no abnormalities. Reduced feces were seen in Groups 6, 7, and 8. Hunched posture and lethargy was noted in all Group 7 animals. Findings of appears thin, lethargic, and hunched posture were noted in all Group 8. One Group 8 animal was also noted as being cold to the touch. All findings in all groups began during the second half of the dosing period and generally persisted until each animal's respective termination. Group mean body weights and body weight gain were generally lower in Groups 4, 5, and 6 compared to Group 1. Group mean body weights and body weight gain

were much lower in Groups 7 and 8 compared to Group 1 for all days during the dosing period save the first few. Predose food consumption values in Groups 1, 3, 4, and 5, excepting the first six postdose days in Group 4, were generally similar to postdose values. Similar predose and postdose food consumption values were also seen in Group 2. Decreased postdose food consumption compared to predose food consumption was seen in Groups 6, 7, and 8.

Conclusion

The presence of soil in the diet at percentages of up to 20% did not appear to result in palatability issues with the mice as predose food consumption values in Groups 1, 3, 4, and 5 were generally similar to postdose values. The presence of clay fragments or extracts of soil or clay fragments in the diet resulted in reduced food consumption. Whether this decreased food consumption is due to palatability issues or to toxic effects related to the increased levels of PAHs contained in these diets (particularly the Group 7 and 8 diets) cannot be determined. The analytical results for samples of diet preparations demonstrate that the preparation methodology is capable of producing consistent doses of PAHs to mice through delivery in feed. The methodology for diet formulation of a spiked positive control group using reagent-grade B(a)P requires additional effort to ensure a consistent level of exposure to B(a)P for this testing group.

Schedule of Events

Study Initiation:	14-Feb-2014
Experimental Start:	20-Feb-2014
First Day of Dosing:	26-Feb-2014
In-Life Termination:	12-Mar-2014
Experimental Completion:	13-Mar-2014

Regulatory Compliance

This non-GLP study was performed according to the protocol and testing facility standard operating procedures.

Test Article and Positive Control

Identification	Test Articles - Sieved soil/fragments, extracts in acetone. Positive Control - Benzo(a)pyrene B(a)P
Lot Number	1304777-07A: Clean Sample (Group 1) SLBF45S3V: Benzo(a)pyrene (Sigma-Aldrich) (Group 2) 1304777-01A: Soil Test Articles (Groups 3, 4, 5) 1304777-04A: Soil Test Article Extract (Group 6) 1304777-08A: Fragment Article (Group 7) 1304777-11A: Fragment Article Extract (Group 8)
Purity/Correction Factor	Test articles and positive control were used without a correction factor
Bulk Stability	Information about bulk stability of either the test articles or positive control were not provided.
Storage Conditions	Positive control stored at ambient room temperature. Test article stored refrigerated at a target temperature of 2-8 °C.
Characteristics	Any information methods, composition, or other characteristics that define the test article or positive control articles, which were supplied by the Sponsor/manufacturer, are included in the study file and copies can be found in Appendix A.
Safety	An MSDS was provided for the B(a)P. Specific laboratory safety procedures were employed when working with the positive control and test articles. A memo detailing safety procedures associated with this study had been circulated and placed in the study file.
Retention Sample	No retention sample was collected.

Accountability	Test articles and positive control were used in a manner designed to preclude the possibility of contamination or deterioration, and with regard to employee safety. Test articles and positive control accountabilities were maintained according to testing facility SOPs.
Disposition	Remaining test articles and positive control article were discarded (see deviation in Appendix C).

Vehicle Components

Identification	No vehicle was used. The sieved soil, extracts, or B(a)P were mixed directly into the diet.

Dose Formulation

Frequency of Preparation	All diets except Group 6 were prepared once prior to dosing. A 600 gram batch of Group 6 soil extract test article diet was prepared on Day -12. Samples of this preparation were sent to ALS Environmental to measure homogeneity and concentration analysis. A second Group 6 diet was prepared on Day -1. This second batch prepared was the batch fed the animals on study.
Procedures	Diet batch size for all Groups was 600 grams. Diet preparation procedures for each group are described below (see deviation in Appendix C). **Sieved soil test articles (Groups 1, 3, 4, 5, and 7)** The appropriate amount of test article (soil) was initially incorporated into a small amount of rodent meal followed by mixing with the remaining amount of meal for that batch in a freezer bag. The total calculated amounts of soil added to each group and the amounts of NIH-31 meal to which these were added is shown below (note that actual amounts added may vary from calculated by

0.1 gram or less):

Group 1 – 60 grams soil (1304777-07A) to 540 grams meal

Group 3 – 30 grams soil (1304777-01A) to 570 grams meal

Group 4 – 60 grams soil (1304777-01A) to 540 grams meal

Group 5 – 120 grams soil (1304777-01A) to 480 grams meal

Group 7 – 60 grams clay target fragment (1304777-08A) to 540 grams meal

Mixing for each diet of each group was 15 minutes. The bags were placed in a labeled bucket and placed in a 2-8 °C refrigerator.

Care was taken not to grind or otherwise crush soil test articles during mixing.

Benzo(a)pyrene Positive Control (Group 2)

B(a)P (Group 2) diet was prepared by weighing out 15 mg B(a)P (Lot# SLBF45S3V) and mixing with 600 grams NIH-31 diet in a freezer bag for approximately 15 minutes.

Diet Preparation for Groups 6 and 8

Stock Diet Preparation - Groups 6 and 8 required the preparation of highly concentrated *stock diet* which would be subsequently added to NIH-31 meal to obtain the meal to be offered to the animals on study. The stock diets for both Group 6 and 8 were prepared in a similar manner. Each diet was prepared by applying the total volume of each acetone extract, 104 mL in each case, (1304777-11A for the fragment/clay extract and 1304777-04A for the soil extract) directly from the bottle containing the extract to 68 grams of NIH-31 rodent meal. This was accomplished by dribbling 8 to 10 mLs extract down a metal spatula directly onto the diet and mixing with a metal spatula for 2-3 minutes. After 10 to 12 additions and mixes of extract the entire volume of extract had been added to the 68 grams of diet. The vial

formerly containing either soil or fragment extract was then rinsed with 5 mL of methylene chloride, and the rinsate was applied directly to the extract diet. The vial rinsing and additions of rinseate to diet were performed three times. Note that for Group 8 the methylene chloride rinses involved vigorously swirling each 5-mL rinse in the bottle in which the fragment test article was contained. This vigorous swirling was performed following the observation of notable residue on the interior of the bottle. The stock diet next needed to be dried as it had been saturated by the addition of 104 mL of acetone extract and 15 mL of methylene chloride. Drying of the stock diet was accomplished by blowing off the acetone and methylene chloride with a steady stream of nitrogen under a hood. Once dry, the 68 g of meal with the soil or fragment extract now mixed in was considered a stock diet. In order to prepare the diet used to feed Groups 6 and 8 animals, a portion of these stock diets was mixed with NIH-31 meal as described below.

Preparation of Diet to be Fed to Group 6 – Group 6 diet was prepared twice. The first preparation was to obtain material to be sent to ALS Environmental to examine the accuracy of the diet mix procedures by measuring the homogeneity and concentration of the diet mixture. The second preparation was the preparation fed to the animals on study.

The Group 6 *stock* diet was prepared once, as described above.

Both the diet for homogeneity and concentration analysis, and the diet which was fed to the animals, used the one single stock diet preparation.

To prepare the first Group 6 soil extract test article diet (for homogeneity and concentration analysis) 16.6 g of stock diet was mixed with 583.4 g of NIH-31 meal to obtain 600 g of diet.

To prepare the second Group 6 diet, 7.0 g of stock diet was mixed with 105 g of NIH-31 meal and

	488 g of the first Group 6 batch prepared (the batch prepared for homogeneity and concentration analysis) to obtain 600 g of diet. Mixing of diets occurred in a ziplock freezer bag. NIH-31 meal, stock diets, and previously mixed diet in the case of the second Group 6 preparation, were added to the freezer bag. The bag was sealed and then rotated by hand in a counterclockwise for approximately 15 minutes to mix. Diet Preparation for Group 8 - To prepare Group 8 fragment extract test article diet, 51 g of stock diet was mixed with 549 g of NIH-31 meal to obtain 600 g of diet. The amount of stock diet added was approximately 30% over the amount required to be added based on calculations derived from the calculated ppm of Benzo(a)pyrene based on the B(a)P level in fragment extract sample 1304777-11A supplied by ALS Environmental. Diet mixing occurred in a ziplock freezer bag. NIH-31 meal and stock diet were added to the freezer bag. The bag was sealed and then rotated by hand in a counterclockwise for approximately 15 minutes to mix. All calculations used to prepare diets were provided to the Sponsor Contact for verification prior to diet preparation. Diet preparation only proceeded following approval of all calculations by Sponsor.
Storage Conditions	Test article and positive control diets were stored refrigerated at 2-8 °C with an exception noted in deviation in Appendix C.

Diet Formulation Analysis

Concentration and Homogeneity	The concentration was determined for each test diet prepared. Prior to analysis, these samples were stored under monitored refrigerated conditions at 2-8 ^{o}C. Duplicate samples were collected (approximately 20 g each sample) from the top, middle, and bottom of each test diet preparation. One set of each of the above duplicate concentration samples were shipped with ice packs to ALS Environmental for Dose Formulation Analysis. The duplicate sets were retained at a controlled temperature of 2-8 ^{o}C as a backup at the Testing Facility. Additionally, a single, approximately 20-g sample of the stock diet, used to prepare Group 6, was collected and sent to ALS Environmental for Dose Formulation Analysis.
Stability	Stability testing was not performed.
General	Results from formulation analyses were included in formulation analytical reports, which are included in Appendix B. All remaining dose formulations were properly discarded when the final dose formulation reports were issued.

Test System

Humane Care of Animals

Treatment of the animals (including but not limited to all husbandry, housing, and feeding conditions) was conducted in accordance with the guidelines recommended in Guide for the Care and Use of Laboratory Animals (National Academy Press, Washington DC, 2011). Housing also conformed to the USDA Animal Welfare Act (9 CFR Parts 1, 2, and 3).

Species	*mus musculus*
Strain	B6C3F1

Source	Charles River Laboratories, Raleigh, NC
History	The animals were experimentally naïve.
Age at Initiation of Dosing	11.9 weeks
Weight at Initiation of Dosing	18.5-22.1 g (see deviation in Appendix C)
Number and Sex	32 females, plus 3 extra
Identification	An ear tag with a matching cage card was used.
Justification	Mice are commonly used in safety evaluation studies that are accepted by appropriate regulatory agencies. The total number of animals used in this study was the minimum required to properly achieve study objectives. This determination was based on historically established conventions in the industry for this type of study.
Receipt and Acclimation	Animals were received from their source and acclimated to the facility and husbandry conditions according to Facility SOPs. Prior to release to study, health status of the animals was reviewed by a member of the veterinary staff. Data collected on animals prior to release to study were maintained as facility records.
Housing/Sanitation	Upon receipt, animals were housed singly and in stainless steel wire bottom cages. Following randomization, animals were housed four per cage, each group in a single cage, in Nalgene® metabolism cages. Animal room and cage cleaning were performed according to testing facility SOPs.
Diet	Certified NIH-31 diet as meal was available *ad libitum* with an exception noted in a deviation in Appendix C. Analysis of diet had been performed by the manufacturer and had been certified to be within specifications.

Water	Tap water filtered through a 0.22-µM PES filter was available *ad libitum* while mice were in their home cage with a deviation noted in Appendix C. Water filtered was supplied by the City of Painesville and was routinely analyzed to monitor chemical and bacterial levels and to determine priority pollutants.
Contaminants	Results of the food and water analyses were reviewed periodically by a staff veterinarian or designee. No contaminants were known to be present in the food or water that might interfere with the results of the study.
Environment	Temperature: 68 – 79°F (20 – 26 °C) Humidity: 30 – 70% Light: An alternating 12-hour light/dark cycle was maintained, except during study-specific procedures. Addition or loss of time due to Daylight Savings time adjustments was not considered a deviation. Ventilation: The airflow was set for at least 10 air changes per hour with 100% fresh air (no air recirculation). The environmental conditions of the animal room were monitored and documented.
Environmental Enrichment/ Supplements	Species-specific enrichment or supplements were provided per facility SOPs.
Animal Care and Use Statement	The research described does not unnecessarily duplicate previous animal experiments and was being conducted in the absence of acceptable nonanimal alternatives to accomplish its objectives. The protocol and any amendments or procedures involving the care or use of animals in this study were reviewed and approved by Ricerca's Institutional Animal Care and Use Committee (IACUC) prior to the initiation of such procedures (i.e., prior to the start of the study for most protocol-specified procedures).

Palliative and Prophylactic Measures	The Study Director, in consultation with a staff veterinarian, approved euthanasia of Group 8 animals. Observations seen by the staff veterinarian were thin, hunched posture, cold to the touch, and body weight loss and reduced body weight gain.

Study Design

Randomization	Animals considered healthy and acceptable for study were assigned to Study Groups using a computer-generated randomization procedure based on body weight. Randomization into study groups occurred on Day -6 (see deviation in Appendix C). Animals not assigned to study groups were allocated into a spare group. Spare animals were released from study on Day 2.
Predose	Animals were acclimated to the study room for 21 days prior to initiation of dosing. Predose data (e.g. veterinary examinations, etc) collected to facilitate selection of animals for randomization to the study were maintained in the study files.
Treatment Groups and Dose Administration	The mice were assigned to groups as shown in the table below. The first day of administration was designated as Day 1 of the study.

Group Assignment and Dose Levels

Dose Group	Number of Animals (Female)	Test Article	Test Article Lot Number	Dose Level*	
1	4	Sieved soil to 250 µM negative control	1304777-07A	10% (w/w) of diet	
2	4	Benzo(a)pyrene [B(a)P] Positive control	SLBF45S3V	25 ppm B(a)P	
3	4	Sieved Soil	1304777-01A	5% (w/w) of diet	12.5 ppm B(a)P
4	4	Sieved Soil	1304777-01A	10% (w/w) of diet	25 ppm B(a)P
5	4	Sieved Soil	1304777-01A	20% (w/w) of diet	50 ppm B(a)P
6	4	Extract of Sieved Soil	1304777-04A	B(a)P ppm Equivalent of Group 4 (10% of diet)	25 ppm B(a)P
7	4	Pulverized Clay Target Fragment	1304777-08A	10% of diet	110 ppm B(a)P
8	4	Extract of Pulverized Clay	1304777-11A	B(a)P ppm Equivalent of Group 7 (10% of diet)	110 ppm B(a)P

*Percentage shown is percent soil in the diet; ppm shown for Groups 3, 4, and 5 is calculated ppm of Benzo(a)pyrene based on the B(a)P level in soil sample 1304777-01A supplied by ALS Environmental; ppm shown for Group 6 is calculated ppm of Benzo(a)pyrene based on the B(a)P level in soil extract sample 1304777-04A supplied by ALS Environmental; ppm shown for Group 7 is calculated ppm of Benzo(a)pyrene based on the B(a)P level in fragment sample 1304777-08A supplied by ALS Environmental; ppm shown for Group 8 is calculated ppm of Benzo(a)pyrene based on the B(a)P level in fragment extract sample 1304777-11A supplied by ALS Environmental.

Dose Administration

Dose Administration

Animals received the test or positive control articles mixed in their diet for up to 14 consecutive days. Groups 1-7 were terminated the day following completion of dosing (Day 15). Group 8 animals were terminated on Day 10.

Route of Administration	All administrations were given by the oral route as a diet admixture.
Justification of Route	This administration route was consistent with the route of exposure used in “Technical Report for Experiment No. 6722: Chronic Bioassay of Two Composite Samples From Selected Manufactured Gas Plant Waste Sites”, Beland and Culp, 1998.
Justification of Dose Levels	Dose levels were selected by the Study Director in agreement with the Sponsor and based on available data.
Justification of Frequency	The frequency of administration was conventional for studies of this type.

In-Life Observations and Measurements

Toxicity Animals

Viabilities	Animals were observed for viability once in the morning and once in the afternoon, at least 4 hours apart, throughout the study.
Clinical Observations	Daily cageside clinical observations were performed and recorded at approximately the same time each day.
Detailed Clinical Observations	Detailed clinical observations were performed prior to randomization (Day -6).
General	Animals appearing to be in pain or distress were brought to the attention of the Study Director and/or a staff veterinarian.

Body Weights	Body weights were measured predose on Days -19, -16, -13, -9, and -6 to monitor animal body weights. Animal body weights of 22 to 24 g were required for use on study; however, the animal's body weights were 18.5 to 22.1 g on Day 1 (see deviation in Appendix C). Additional body weights were measured prerandomization (Days -5 to -1), and daily for the remainder of the in-life period (Days 1 to 15).
Food Consumption	Quantitatively, 6 days predose, and daily for the remainder of the in-life. Food consumption per cage was divided by four to obtain average food consumption per animal.
Observations for Potential Fecal Contamination	Twice daily observations of the urine collection cups were performed on Days 2-14, and once daily observations of the urine collection cups were performed on Days 1 and 15 (see deviation in Appendix C). Fecal contamination of collected urine was recorded. Pictures were taken daily of pooled urine. These photographs are maintained in the study file but not reported. Future studies will include measurement of urine volume at time of sample collection. Feces were removed from metabolism cages once daily.

Urine Collection

Sample Collection	Urine samples were collected daily from each cage (Days 1-14 for Groups 1-7 and Days 1-10 for Group 8). Daily urine samples from each cage (i.e. – pooled urine from each group) were stored refrigerated at 2-8 °C up to Day 17 and then moved to a freezer set to maintain -70 °C until shipped (see deviation in Appendix C). Urine samples were stored in prelabeled urine collection vials, until shipment to the analytical lab on Day 20. Samples were shipped on ice packs.

Urine Analysis	The results of the bioanalytical analysis of urine by AXYS Analytical Services are reported separately.

Euthanasia/Necropsy

Morbidity/Mortality	Group 8 animals were considered moribund on Day 10 and were euthanized by CO_2 overdose on the day the determination was made.
Unscheduled Necropsy	A gross necropsy was conducted on Group 8 animals for the purpose of attempting to determine cause of death and included examination of: All external surfaces and orifices Internal organs and tissues All abnormalities were described and recorded The Group 8 animals were stored frozen after the necropsies were completed. Carcasses were retained by Ricerca for possible future evaluation. And were subsequently disposed of appropriately (see deviations in Appendix C).
Scheduled Necropsy	Following collection of the final in-life samples, all surviving animals were euthanized by CO_2 overdose. Their carcasses were frozen and retained by Ricerca possible future evaluation and were subsequently disposed of appropriately (see deviation in Appendix C).

Major Computer Systems/Software

The computer systems used on this study may have included, but were not limited to, the following systems. All version numbers of the applications, as well as validation or qualification status, were maintained by Ricerca Biosciences, LLC, and were presented in appropriate sections of the final report.

Application Name	**Function**
Siemens REMs	Controls environmental systems in vivarium
Edstrom Watchdog	Monitors and records environmental data in vivarium
Analyst	Bioanalytical data analysis software
Watson	Integrated sample tracking and analysis system
WinNonLin	Pharmacokinetic analysis system
Provantis	In-life test system data and statistical evaluation
TotalChrom	Used for Dose Formulation data collection
Microsoft Office	Collection of word processing and spreadsheets used for report production
RATS	In-house system used to schedule study activities
SAS	statistical analysis of data within Provantis system

Statistical Analysis

When appropriate, numeric animal data were evaluated statistically. Body weight and body weight gain data were considered to be parametric (continuous data, typically with normal distributions) and were evaluated by analysis of variance (ANOVA) with $p \leq 0.05$. If significance existed, pairwise comparisons of each dose group with the control group were made using a *post hoc* test, Dunnett, ($p \leq 0.05$), to identify statistical differences between each dose level group and control values. Comparisons were made at common time points. As the animals did not have access to food on Days -3 and -2, comparative statistics on body weights were not conducted for these days. Additionally, comparative statistics were not performed on food consumption data.

Records

Following completion of analysis and prior to completion of the final report, all materials generated at Ricerca Biosciences, LLC, including hard-copy raw data and final report and any biological and formulation samples were shipped to the Sponsor.

External test sites were responsible for archiving data produced at their own sites.

Results and Discussion

Dose Analysis

Dose Analysis: Appendix B

Diet samples (20 grams each) were collected from each of the 8 diet test groups. Samples were sent to ALS Environmental to perform analyses of PAH concetrations to confirm the calculated dose levels and consistency of diet preparation. Five diet perparations were analyzed for PAHs: Group 2 (25 ppm B(a)P spiked), Group 4 (10% Soil – 25ppm B(a)P), Group 6 (10% Soil Extract – 25 ppm B(a)P), Group 7 (10% Fragment – 110 ppm B(a)P), and Group 8 (10% Fragment Extract – 110 ppm B(a)P). Diet preparations were analyzed in triplicate to document reproducibility. The prinicipal PAHs of interest include B(a)P, benz(a)anthracene, and chrysene. The average concetrations of these PAHs and relative standard deviations (RSD) are presented below.

	Benzo(a)pyrene	Benz(a)anthracene	Chrysene
Group 2 (25 ppm B(a)P)	18ppm / 20%	NA	NA
Group 4 (25 ppm B(a)P)	27ppm / 14%	21 ppm / 10%	26 ppm / 17%
Group 6 (25 ppm B(a)P)	25 ppm / 3%	18 ppm / 11%	25 ppm / 3%
Group 7 (110 ppm B(a)P)	125 ppm / 5%	106 ppm / 8%	127 ppm / 5%
Group 8 (110 ppm B(a)P)	104 ppm / 20%	90 ppm / 23%	118 ppm / 19%

Note: Concetrations presented as ppm / relative standard deviation (%)

The analytical results for PAHs in diet formulations indicate that the 10% Soil diet (Group 4) with B(a)P at 27 ppm and 10% Fragment diet (Group 7) with B(a)P at 125 ppm were very close to the target concentrations for B(a)P of 25 ppm and 110 ppm, respectively. The Group 6 Soil Extract diet was right on the target concentration, while the Group 7 Fragment Extract diet B(a)P concentration (104 ppm) was slightly below the target concentration of 110 ppm. The RSD values presented a measure of variation of PAH concentrations within triplacte sample results. The Fragment Extract samples exhibited the greatest degree of variation among the test groups. The Group 2 (B(a)P spiked) triplicate samples had low concentrations ranging from 6.6 ppm to 20 ppm indicating the methodology for addition of laboratory reagent-grade B(a)P to diet should be revised prior to the main study.

Mortality

Mortality Data: Table 1

With the exception of Group 8, no unscheduled mortality occurred on study. Based on clinical observations of thin, hunched posture, cold to the touch, and also body weight loss and reduced body weight gain, Group 8 animals were sacrificed moribund on Day 10.

Observations

Summary of Observations by Group: Table 2 and Table 3
Summary of Observations by Day: Table 4
Individual Observations: Table 11

There were no observations considered to be test article related in Groups 1 to 5. Reduced feces were seen in Groups 6, 7, and 8 starting from Days 8 or 9. This finding persisted in Group 6 until Day 14 and persisted in Groups 7 and 8 until termination. The reduced feces in these groups are likely associated with the reduced food consumption seen in these groups. Hunched posture was noted in all Group 7 (clay target fragment) animals starting on Day 12 and persisting until termination on Day 15. Lethargy was noted in all Group 7 animals on Day 15. Starting on Days 8, 9, or 10, findings of appears thin, lethargic, and hunched posture were noted in all Group 8 (clay fragment extract) animals. One Group 8 animal was also noted as being cold to the touch on Day 10.

Observations for Potential Fecal Contamination

Potential Fecal Contamination: Table 5

Fecal pellets were not observed in the urine collection cups at any time on study. The urine within the collection cups was occasionally noted to be brownish/amber or darker in color than would be expected. This discoloration may be due to urine coming into contact with feces as it passed down the collection apparatus of the metabolism cage on its way to the urine collection cup.

Photographs of urine collection cups taken daily during the in-life phase of the study are maintained in the study file but are not reported here.

Body Weights

Mean Body Weights: Table 6
Mean Body Weight Gain: Table 7 and Table 8
Individual Body Weights: Table 12
Individual Body Weight Gain: Table 13

Group mean body weights and body weight gain were similar between Groups 1, 2, and 3. Group mean body weights and body weight gain were generally lower in Group 4 compared to Group 1, but the difference was only occasionally statistically significant. Group mean body weights and body weight gain were generally lower in Groups 5 and 6 compared to Group 1 and for Group 5 only the difference was usually statistically significant during the second week of the dosing period. Group mean body weights and body weight gain were lower in Groups 7 and 8 compared to Group 1 for all days during the dosing period save the first few. These differences were always statistically significant for both groups.

Food Consumption

Mean Food Consumption: Table 9
Individual Food Consumption: Table 14

Group mean food consumption in Groups 2 and 3 were similar to Group 1 throughout the dosing period. Group mean food consumption in Groups 4 and 5 was consistently less than Group 1 for the first 6 days of the dosing period and similar to Group 1 for the remaining days. Group mean food consumption in Group 6 was consistently less (up to 40% less) than Group 1 for the entire dosing period. Group mean food consumption in Groups 7 and 8 was dramatically and consistently decreased for the entire dosing period when compared to Group 1. Group 7 mean food consumption compared to Group 1 food consumption was deceased by about 30 to 50% at all but a few days during the dosing period. Group 8 mean food consumption compared to Group 1 food consumption was deceased by greater than 50% at all but a few days during the dosing period.

The presence of soil in the diet at percentages of up to 20% did not negatively affect food consumption as shown by predose food consumption values in Groups 1, 3, 4, and 5 that, excepting the first 6 postdose days in Group 4, were generally similar to postdose values. The presence of up to 25 ppm B(a)P in the diet also did not negatively affect food consumption as shown by similar predose and postdose food consumption values in Group 2. The presence of clay fragments or extracts of soil or clay fragments in the diet did negatively affect food consumption as shown by decreased postdose food consumption compared to predose food consumption in Groups 6, 7, and 8.

Necropsy

Individual Necropsy Observations: Table 15

Gross necropsies were performed on the Group 8 animals sacrificed moribund. No abnormalities were noted in any animal.

Conclusion

The presence of soil in the diet at percentages of up to 20% did not appear to result in palatability issues with the mice as predose food consumption values in Groups 1, 3, 4, and 5 were generally similar to postdose values. The presence of clay fragments or extracts of soil or clay fragments in the diet resulted in reduced food consumption. Whether this decreased food consumption is due to palatability issues or to toxic effects related to the increased levels of PAHs contained in these diets (particularly the Group 7 and 8 diets) can not be determined. The analytical results for samples of diet preparations demonstrate that the preparation methodology is capable of producing consistent doses of PAHs to mice through delivery in feed. The methodology for diet formulation of a spiked positive control group usingreagent-grade B(a)P requires additional effort to ensure a consistent level of exposure to B(a)P for this testing group.

Certificate of Analysis

Product Name:
Benzo[a]pyrene – ≥96% (HPLC)

Product Number:	**B1760**
Batch Number:	**SLBF4553V**
Brand:	SIGMA
CAS Number:	50-32-8
MDL Number:	MFCD00003602
Formula:	C20H12
Formula Weight:	252.31 g/mol
Quality Release Date:	07 DEC 2012
Recommended Retest Date:	DEC 2016

Test	Specification	Result
Appearance (Color) Light Yellow to Yellow-Green, Yellow-Brown, or Yellow-Orange	Light Yellow to Yellow-Green, Yellow-Orange	Yellow
Appearance (Form)	Powder	Powder
Solubility (Color) Light Yellow to Yellow-Green, Yellow-Brown, or Yellow-Orange	Light Yellow to Yellow-Green, Yellow-Orange	Yellow
Solubility (Turbidity) 50 mg/mL, CHCl3	Clear	Clear
Purity (HPLC)	≥ 96 %	97 %

Re: Foster Pilot Study Work Order: **14030085**

Dear Glenn,

ALS Environmental received 22 samples on 28-Feb-2014 09:20 AM for the analyses presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

The total number of pages in this report is 25.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Bethany McDaniel

Electronically approved by: Jumoke M. Lawal

Case Narrative

Batch 77275, PAHs by Method SW8270, Sample "45-Middle": Surrogate recovery, 4-Terphenyl-d14, was above the control limits.

Batch 77275, PAHs by Method SW8270, Insufficient sample to perform MS/MSD. LCS/LCSD provided as batch quality control.

Batch 77275, PAHs by Method SW8270: Low area counts for all internal standards in all samples except "41-Bottom" and "45-Middle". Sample re-ran with simlilar results.

Batch 77275, PAHs by Method SW8270: Sample "41-Bottom" had low area counts for all internal standards except Chrysene-d12.

Batch 77275, PAHs by Method SW8270: Sample "45-Middle" had low area counts for all internal standards except Phenanthrene-d12.

QUALIFIERS, ACRONYMS, UNITS

Qualifier	Description
*	Value exceeds Regulatory Limit
a	Not accredited
B	Analyte detected in the associated Method Blank above the Reporting Limit
E	Value above quantitation range
H	Analyzed outside of Holding Time
J	Analyte detected below quantitation limit
M	Manually integrated, see raw data for justification
n	Not offered for accreditation
ND	Not Detected at the Reporting Limit
O	Sample amount is > 4 times amount spiked
P	Dual Column results percent difference > 40%
R	RPD above laboratory control limit
S	Spike Recovery outside laboratory control limits
U	Analyzed but not detected above the MDL

Acronym	Description
DCS	Detectability Check Study
DUP	Method Duplicate
LCS	Laboratory Control Sample
LCSD	Laboratory Control Sample Duplicate
MBLK	Method Blank
MDL	Method Detection Limit
MQL	Method Quantitation Limit
MS	Matrix Spike
MSD	Matrix Spike Duplicate
PDS	Post Digestion Spike
PQL	Practical Quantitation Limit
SD	Serial Dilution
SDL	Sample Detection Limit
TRRP	Texas Risk Reduction Program

Units Reported	Description
µg/Kg	Micrograms per Kilogram

From: Richard Shea

The enclosed shipment was sent overnight on ice packs and contains sieved soil extract samples for analysis from Ricerca Study 030947.

Please electronically return signed copies of this letter and sample transfer form upon the arrival of this shipment.

Sincerely,

Richard Shea

APPENDIX C

Deviations, Protocol, and Amendments

Deviations with Study Impact

None

Deviations with No Study Impact

The protocol on page 4 stated that remaining test articles would be transferred for use on a future study or returned to the Sponsor. Remaining test articles were disposed. Sponsor requested that remaining test articles be disposed and noted that new test article would be provided for future study or studies.

Group 4 diet mix was prepared by adding the required amount of soil sample to the required amount of diet in a plastic freezer bag and mixed by sealing the bag and inverting/shaking the bag for 15 minutes. A bowl, mixing spoon, and blender were not used as stated in the protocol. Group 6 stock diet was mixed in by adding extract to diet in a 600-mL beaker and mixing with a metal spatula. The protocol stated this step would be performed in a bowl with a mixing spoon. Acetone and methylene chloride were blown off with nitrogen, rather than being allowed to passively evaporate as the protocol stated. Study 030947 is a pilot study and the diet mix procedure that occurred on the 14th may be used as a pilot diet mix. The protocol describes procedures that may be superseded by more appropriate procedures once the mixing process begins. Protocol deviations are expected given the pilot nature of this study.

The protocol specified that test article and positive control diets were to be stored refrigerated at 2-8 ^{o}C. On several occasions the temperature dropped to 1.9 ^{o}C, but never for longer than 15 minutes. The temperature deviations were only 0.1 degree below the target and were for a very short duration (less than 15 minutes).

A requirement of the protocol was that the animals' body weights be between 22 to 24 g. The body weights of the animals on Day 1 ranged from 18.5 to 22.1 g. The numerous animals outside the protocol-specified body weight range on Day 1 is a function of the random, expected, fluctuation in daily animal body weights.

Certified NIH-31 diet was not available *ad libitum* for the duration of the study period. On Day -3, improper filling of the metabolism cage feeders occurred and animals had no access to feed from Day -3 to -2. One cage was also found without water on Day -3; the specific cage was not specified in the raw data. This incident occurred prior to study start, and all animals appeared healthy and normal despite reduced feed and water for this period.

The protocol specified that animals were to be randomized on Day -2, -3, or -4. The animals were randomized to study on Day -6. To provide at least 5 days of acclimation to the cages and to the other animals in the group, animals were randomized directly into their groups sooner than the protocol directed.

The protocol specified that twice-daily urine collection cup observations were to be collected. On Days 1 and 15, the urine collection cup observation was completed once per group instead of twice. Making these observations only once on these days is reasonable given the timing of when the study started on Day 1 and when it ended on Day 15.

The protocol specified that urine samples were to be stored refrigerated at 2-8 ^{o}C. On Day 17 the urine samples were moved to a freezer, set to maintain -70 ^{o}C, until the samples were shipped. This deviation was taken following instructions from the Sponsor to store samples at -70 ^{o}C as -70 ^{o}C is the more appropropriate storage temperature.

Page 13 of the protocol specified that animals terminated at scheduled sacrifices would have their carcasses frozen and retained for up to 3 months. Page 12 of the protocol discussed moribund sacrifices but did not provide instructions to freeze and retain carcasses instead stating only that there would be a gross necropsy with moribund sacrifices. All animals in Group 8 were sacrificed moribund on 7-March-2014 (Study day 10). These Group 8 animals were stored frozen after the necropsy. Large numbers of moribund sacrifices were not anticipated and so freezing and retention of moribund sacrifices was not included in the protocol. Freezing and retention of these moribund sacrifice carcasses is desirable as these carcasses may be shipped to the Sponsor for analysis; therefore, freezing of these carcasses was performed.

The protocol on pages 13 stated that carcasses of animals would be retained for up to 3 months. All carcasses were retained for greater than 3 months. Sponsor requested that carcasses be retained beyond 3 months.

Protocol

Technical Director, Analytical:	Jason Blanchard, M.Sc.

Attending Veterinarian: Michael J. Stonerook, Ph.D., D.V.M., DABT

Introduction

Objective(s)

The objective(s) of this study are to determine palatability of soil and extract diet mixtures and provide urine samples to test analytical methods for analyzing the presence of polycyclic aromatic hydrocarbons in urine.

Sponsor

Arcadis U.S., Inc.

Proposed Schedule of Events

Study Initiation:	Date protocol/study plan is signed by study director
Experimental Start:	February-2014
First Day of Dosing:	February-2014
Last Day of Dosing:	February-2014
Experimental Completion:	The date the last subreport is signed.

Regulatory Compliance

This non-GLP study will be performed according to the protocol and testing facility standard operating procedures.

Test Article and Positive Control

Identification	Test Articles - Sieved soil/fragments, extracts in acetone. Positive Control - Benzo(a)pyrene B(a)P

Lot Number	1304777-07A: Clean Sample (Group 1) SLBF45S3V: Benzo(a)pyrene B(a)P (Group 2) 1304777-01A: Soil Test Articles (Groups 3, 4, 5) 1304777-04A: Soil Test Article Extract (Group 6) 1304777-08A: Fragment Article (Group 7) 1304777-11A: Fragment Article Extract (Group 8)
Purity/Correction Factor	Test articles and positive control will be used without a correction factor
Bulk Stability	Any available information about bulk stability of either the test articles or positive control will be included in the study file.
Storage Conditions	Positive control to be stored at ambient room temperature. Test article to be stored refrigerated at a target temperature of 2-8°C.
Characteristics	Any information methods, composition, or other characteristics that define the test article or positive control articles, which are supplied by the sponsor/manufacturer, will be included in the final report.
Safety	An MSDS or other suitable document will be provided for the Benzo(a)pyrene (B(a)P). Specific laboratory safety procedures will be employed when working with the positive control and test articles. A memo detailing safety procedures associated with this study has been generated, circulated, and placed in the study file. .
Retention Sample	No retention sample will be collected.
Accountability	Maintained according to testing facility SOPs
Disposition	Remaining test articles and positive control article may be transferred for use on a future study prior to finalization of the study report, or will be returned to the Sponsor should additional studies not be conducted.

Vehicle Components

Identification	No vehicle to be used. The sieved soil, extracts, or B(a)P will be mixed directly into the diet.

Dose Formulation

Frequency of Preparation All diets will be prepared once prior to dosing.

Procedures	Extract test articles - The extract test article will be initially incorporated into diet by applying the total volume of extract in acetone directly from the vial to a small amount of rodent meal using a bowl and mixing spoon. The acetone will be allowed to evaporate from the diet under a hood. The vial will then be rinsed with 5 milliliters of methylene chloride and the rinsate will be applied directly to the extract diet. The vial rinsing and additions of rinsate to diet will be performed three times. Methylene chloride from the vial rinses will be allowed to evaporate under a hood. Documented concentration of B(a)P in extract will be used to calculate concentration in extract diet preparation. An appropriate amount of this diet will be mixed in a blender with the remaining amount of meal for that batch to match the 10% Soil Test Article diet concentration for B(a)P. The initial diet mix of Group 6 soil extract (on February 14, 2014) will occur as above with the exception that the stock diet will be mixed with remaining meal by hand rather than in a blender. All calculations used to prepared diets will be provided to the Sponsor Contact for verification prior to diet preparation. Diet preparation will only proceed following approval of all calculations by Sponsor. Positive control and sieved soil/fragment test articles - The appropriate amount of test article will be initially incorporated into a small amount of rodent meal using a bowl and mixing spoon followed by mixing with the remaining amount of meal for that batch in a blender. Duration of mixing for each diet of each group will be recorded and will be a minimum of 15 minutes, with longer durations if deemed necessary. Care will be taken not to grind or otherwise crush soil test articles during mixing. Details of the procedures used will be recorded and included in the final report.
Storage Conditions	Test article and positive control diets to be stored refrigerated at 2-8°C.

Diet Formulation Analysis

Concentration and Homogeneity	The concentration will be determined for each test diet prepared. Prior to analysis, these samples will be stored under monitored refrigerated conditions at of 2-8^{o}C. Duplicate samples will be collected (approximately 20 g each sample) from the top, middle, and bottom of each test diet preparation. One set of each of the above duplicate concentration samples will be shipped on with ice packs to the Contributing Scientist, Dose Formulation Analysis. The duplicate sets will be retained at a controlled temperature of 2-8^{o}C as a backup at the Testing Facility (to be discarded or stored or shipped to Sponsor after satisfactory results have been obtained on the first set of samples).
Stability	Stability testing will not be performed.
General	Results from formulation analyses will be included in a dose formulation report, which will be included in the final study report. All remaining dose formulations will be properly discarded when the final dose formulation report is issued or will be shipped to the Sponsor or the Sponsor's designated laboratory.

Test System

Humane Care of Animals

Treatment of the animals (including but not limited to all husbandry, housing, and feeding conditions) will be conducted in accordance with the guidelines recommended in Guide for the Care and Use of Laboratory Animals (National Academy Press, Washington DC, 2011). Housing will also conform to the USDA Animal Welfare Act (9 CFR Parts 1, 2, and 3).

Species	mus musculus
Strain	B6C3F1

Source	Charles River Laboratories
History	The animals will be experimentally naïve.
Weight at Initiation of Dosing	Target of 22-24 grams
Number and Sex	32 females, plus 3 extra
Identification	An ear tag with a matching cage card will be used.
Justification	Mice are commonly used in safety evaluation studies that are accepted by appropriate regulatory agencies. The total number of animals used in this study was the minimum required to properly achieve study objectives. This determination was based on historically established conventions in the industry for this type of study.
Receipt and Acclimation	Animals will be received from their source and acclimated to the facility and husbandry conditions according to Facility SOPs. Prior to release to study, health status of the animals will be reviewed by a member of the veterinary staff. Data collected on animals prior to release to study will be maintained as facility records.
Housing/ Sanitation	Upon receipt, animals will be housed singly and in stainless steel wire bottom cages. Following randomization, animals will be housed four per cage, each group in a single cage, in Nalgene® metabolism cages. Animal room and cage cleaning will be performed according to testing facility SOPs.
Diet	Certified NIH-31 diet as meal will be available ad libitum, except during protocol-specified periods of fasting. Analysis of diet has been performed by the manufacturer and has been certified to be within specifications.
Fasting	The animals will be fasted as noted in subsequent section(s) of the protocol for dosing or data-specific collection periods.

Water	Tap water filtered through a 0.22 µM PES filter will be available ad libitum while mice are in their home cage. Water to be filtered will be supplied by the City of Painesville and is routinely analyzed to monitor chemical and bacterial levels and to determine priority pollutants.
Contaminants	Results of the food and water analyses are reviewed periodically by a staff veterinarian or designee. No contaminants are known to be present in the food or water that may interfere with the results of the study.
Environment	Temperature: 68 – 79°F (20 – 26°C) Humidity: 30 – 70% Light: An alternating 12-hour light/dark cycle will be maintained, except during study-specific procedures. Addition or loss of time due to Daylight Savings time adjustments will not be considered as deviations. Ventilation: The airflow will be set for at least 10 air changes per hour with 100% fresh air (no air recirculation). The environmental conditions of the animal room will be monitored and documented.
Environmental Enrichment/ Supplements	Species-specific enrichment or supplements will be provided per facility SOPs.

Study Design

Randomization	Animals considered healthy and acceptable for study will be assigned to Study Groups using a computer-generated randomization procedure based on body weight. Control for siblings will be performed, if possible. Randomization into study groups will occur on Day -2, -3, or -4. Animals not assigned to study groups will be allocated into a spare group. Spare animals will be released from study on or after Day 1.

Predose

Animals will be acclimated to the study room for a minimum of 7 days prior to initiation of dosing.

Animals may be acclimated to study-specific experimental procedures to identify animals which may exhibit increased levels of stress or resistance to the procedure.

Animals deemed unfit to receive test or control article based on predose data (including behavioral issues) will be removed from the study group and replaced by a spare animal.

Predose data (e.g. veterinary examinations, etc) collected for selection of animals to be randomized to study will be maintained in the study files.

Treatment Groups and Dose Administration

The mice will be assigned to groups as shown in the table below. The first day of administration will be designated as Day 1 of the study.

Group Assignment and Dose Levels

Dose Group	Number of Animals (Female)	Test Article	Test Article Lot Number	Dose Level
1	4	Sieved soil to 250 µM negative control	1304777-07A	10% (w/w) of diet
2	4	Benzo(a)pyrene (B(a)P) Positive control	SLBF45S3V	25 ppm
3	4	Sieved Soil	1304777-01A	5% (w/w) of diet
4	4	Sieved Soil	1304777-01A	10% (w/w) of diet
5	4	Sieved Soil	1304777-01A	20% (w/w) of diet
6	4	Extract of Sieved Soil	1304777-04A	B(a)P ppm Equivalent of Group 4 (10% of diet)
7	4	Pulverized Clay Target Fragment	1304777-08A	10% of diet
8	4	Extract of Pulverized Clay	1304777-11A	B(a)P ppm Equivalent of Group 7 (10% of diet)

Dose Administration

Dose Administration

Animals will receive the test or positive control

	articles mixed in their diet for 14 consecutive days. All animals will be terminated the day following completion of dosing.
Route of Administration	All administrations will be given by the oral route as a diet admixture.
Justification of Route	This administration route is consistent with the route of exposure used in “Technical Report for Experiment No. 6722: Chronic Bioassay of Two Composite Samples From Selected Manufactured Gas Plant Waste Sites”, Beland and Culp, 1998
Justification of Dose Levels	Dose levels were selected by the Study Director in agreement with the Sponsor and based on available data.
Justification of Frequency	The frequency of administration is conventional for studies of this type.

In-Life Observations and Measurements

Toxicity Animals

Viabilities	Animals will be observed for viability at least once in the morning and once in the afternoon, at least 4 hours apart, throughout the study.
Clinical Observations	Daily cageside clinical observations will be performed and recorded at approximately the same time each day.
Detailed Clinical Observations	Detailed clinical observations will be performed prior to randomization.
General	Animals appearing to be in pain or distress will be brought to the attention of the Study Director and/or a staff veterinarian.
Body Weights	Body weights will be measured predose, as needed, to monitor animal body weights. Animal body weights of 22 to 24 grams will be required for use on study. Additional body weights will be measured pre-randomization (between Days -5 to -1), and daily for the remainder of the in-life period.
Food Consumption	Quantitatively, once predose, and daily for the remainder of the in-life. Food consumption per

	cage will be divided by four obtain an average food consumption per animal.
Observations for Potential Fecal Contamination	Twice daily observations of the urine collection cups will be performed. Fecal contamination of collected urine will be recorded and feces will be removed if possible. Pictures will be taken daily of pooled urine following transfer to containers used for storage and shipping .

Urine Collection

Sample Collection	Daily from each cage. Daily urine samples from each cage (i.e. – pooled urine from each group) will be stored refrigerated at 2-8°C, in pre-labeled urine collection vials, until shipment to the analytical lab on the first appropriate shipping day following Days 8 (Day 1 to 7 samples) and 14 (Day 8 to 14 samples). Samples will be shipped on ice packs. Should no urine be present in collection cups documentation will be made.

Euthanasia/Necropsy

Morbidity/ Mortality	Animals considered moribund will be euthanized by CO_2 overdose on the day the determination is made.
Unscheduled Necropsy	If an animal is found dead or is euthanized moribund following initiation of dosing, it will be necropsied. If necropsy personnel are not available at the time the animal is found dead or euthanized moribund, the carcass will be refrigerated until necropsy can be conducted. The gross necropsy will be conducted for the purpose of attempting to determine cause of death and will include examination of: All external surfaces and orifices Internal organs and tissues All abnormalities will be described and recorded

Scheduled Necropsy	Following collection of the final in-life samples, all surviving animals will be euthanized by CO_2 overdose and their carcasses will be frozen and retained by Ricerca for up to three months for possible future evaluation. After three months carcasses will be disposed of appropriately or will be shipped to the Sponsor.

Major Computer Systems/Software

The computer systems used on this study may include, but not be limited to, the following systems. All version numbers of the applications, as well as validation or qualification status, are maintained by Ricerca Biosciences, LLC, and will be presented in appropriate sections of the final report.

Application Name	Function
Siemens REMs	Controls environmental systems in vivarium
Edstrom Watchdog	Monitors and records environmental data in vivarium
Analyst	Bioanalytical data analysis software
Watson	Integrated sample tracking and analysis system
WinNonLin	Pharmacokinetic analysis system
Provantis	In-life test system data and statistical evaluation
TotalChrom	Used for Dose Formulation data collection
Microsoft Office	Collection of word processing and spreadsheets used for report production
RATS	In-house system used to schedule study activities
SAS	statistical analysis of data within Provantis system

Statistical Analysis

When appropriate, numeric animal data will be evaluated statistically. Data considered to be parametric (continuous data, typically with normal distributions) will be evaluated by analysis of variance (ANOVA) with $p \leq 0.05$. If significance exists, pairwise comparisons of each dose group with the control group will be made using a post hoc test, Bonferroni or Dunnett, ($p \leq 0.05$). to identify statistical differences between each dose level group and control values. Data

considered to be non-parametric (discontinuous data or non-normally distributed) will be evaluated using a Kruskal-Wallis Test ($p \leq 0.05$) on ranked data for group significance. If significance exists, pairwise comparisons of each dose group with the control group will be made using a post hoc test Wilcoxon with Bonferroni-Holm adjustment, ($p \leq 0.05$).

Statistical evaluation may not be conducted for particular parameters if there is lack of sufficient data due to excess animal mortality or other pertinent factors.

Animal Care and Use Statement

The research described does not unnecessarily duplicate previous animal experiments and is being conducted in the absence of acceptable non-animal alternatives to accomplish its objectives. The protocol and any amendments or procedures involving the care or use of animals in this study will be reviewed and approved by Ricerca's Institutional Animal Care and Use Committee (IACUC) prior to the initiation of such procedures (i.e., prior to the start of the study for most protocol-specified procedures).

Palliative and Prophylactic Measures

The Study Director, in consultation with a staff veterinarian, may approve palliative and/or prophylactic treatment of animals. Under emergency situations, the Study Director authorizes a staff veterinarian to approve palliative and/or prophylactic treatments; under such circumstances the Study Director and Sponsor will be notified of treatment as soon as possible

Quality Assurance

This is a non-GLP study, and therefore no Quality Assurance audits will be conducted.

Sponsor Review

The Sponsor may send representatives to inspect the study and the premises during normal working hours during the course of the study and/or to review the raw data and the final report.

Protocol Changes and Deviations

Changes to the approved protocol will be in the form of amendments approved by the Study Director and the Sponsor Representative. Amendments will clearly

describe the protocol changes and will include the effective date of the change and justification for the change. The Sponsor may authorize protocol changes by telephone or other electronic means when he/she cannot be physically present for signature. Protocol deviations will be noted in the study records and reported.

Records

Following completion of analysis and prior to completion of the final report, all materials generated at Ricerca Biosciences, LLC, including raw data and final report and any biological and formulation samples will be shipped to the Sponsor.

External test sites will be responsible for archiving data produced at their own sites.

Reporting

The Study Director will prepare a final report of the study results. This report will include a comprehensive presentation of data, as well as interpretations of the data. The name and address of the facility conducting the study and dates on which the study was initiated and completed will be included in the report.

Page 6 of Final Protocol

Procedures

Extract test articles - The extract test article will be initially incorporated into diet by applying the total volume of extract in acetone directly from the vial to a small amount of rodent meal **by dribbling extract down a metal spatula directly onto the diet.** ~~using a bowl and mixing spoon~~. ~~The acetone will be allowed to evaporate from the diet under a hood.~~ The vial will then be rinsed with 5 milliliters of methylene chloride and the rinsate will be applied directly to the extract diet. The vial rinsing and additions of rinsate to diet will be performed three times. Acetone, and ~~M~~**m**ethylene chloride from the vial rinses, will be **blown off by a steady stream of nitrogen** ~~allowed to evaporate~~ under a hood. Documented concentration of B(a)P in extract **and or in measured extract mix prepared on February 14, 2014,** will be used to calculate concentration in extract diet preparation. An appropriate amount of this diet will be mixed in a **freezer bag** ~~blender~~ with the remaining amount of meal for that batch to match the 10% Soil Test Article diet concentration for B(a)P.

The initial diet mix of Group 6 soil extract (on February 14, 2014) will occur**ed** as above ~~with the exception that the stock diet will be mixed with remaining meal by hand rather than in a blender~~.

All calculations used to prepared diets will be provided to the Sponsor Contact for verification prior to diet preparation. Diet preparation will only proceed following approval of all calculations by Sponsor.

Positive control and sieved soil/fragment test articles - The appropriate amount of test article will be initially incorporated into a small amount of rodent meal ~~using a bowl and mixing spoon~~ followed by mixing with the remaining amount of meal for that batch in a **freezer bag** ~~blender~~. Duration of mixing for each diet of each group will be recorded and will be a minimum of 15 minutes, with longer durations if deemed necessary.

Care will be taken not to grind or otherwise crush soil test articles during mixing.

Details of the procedures used will be recorded and included in the final report.

Rationale

More appropriate mixing procedures than those described in the original protocol were discovered during the initial mix on February 14, 2014. These procedures are incorporated into the protocol via this amendment.

Page 7 of Final Protocol

Concentration and Homogeneity

The concentration will be determined for each test diet prepared. Prior to analysis, these samples will be stored under monitored refrigerated conditions at of 2-8^{o}C. Duplicate samples

will be collected (approximately 20 g each sample) from the top, middle, and bottom of each test diet preparation.

One set of each of the above duplicate concentration samples will be shipped on with ice packs to the Contributing Scientist, Dose Formulation Analysis. The duplicate sets will be retained at a controlled temperature of 2-8^{o}C as a backup at the Testing Facility (to be discarded or stored or shipped to Sponsor after satisfactory results have been obtained on the first set of samples).

Additionally, a single approximately 20 gram sample of the stock diet used to prepare Group 6 will be collected and sent to the Contributing Scientist, Dose Formulation Analysis.

Rationale

Analysis of Group 6 stock diet may be desired and so a sample is being provided to the ALS.

Page 11 of Final Protocol

Food Consumption

Quantitatively, ~~once~~ **at least three days** predose, and daily for the remainder of the in-life. Food consumption per cage will be divided by four obtain an average food consumption per animal.

Rationale

The original protocol incorrectly listed a single day of predose food consumption. A longer duration of food consumption than one day is desired.

Page 12 of Final Protocol

Observations for Potential Fecal Contamination

Twice daily observations of the urine collection cups will be performed. Fecal contamination of collected urine will be recorded and feces will be removed if possible. Pictures will be taken daily of pooled urine. ~~following transfer to containers used for storage and shipping~~.

Sample Collection

Daily from each cage. Daily urine samples from each cage (i.e. – pooled urine from each group) will be stored refrigerated at 2-8°C, in pre-labeled urine collection vials, until shipment to the analytical lab on the first appropriate shipping day following Day~~s~~ **14**. ~~8 (Day 1 to 7 samples) and 14 (Day 8 to 14 samples~~). Samples will be shipped on ice packs.

Should no urine be present in collection cups documentation will be made.

Rationale

The photographs of pooled urine may occur prior to or subsequent to transfer of the urine to containers used for shipping and so the specification hat photographs must be taken subsequent to this transfer is removed. The analytical lab performing urine analysis has requested that urine samples be retained until all samples are available to be shipped.

Effective Date

The effective date is the date that the amendment is signed by the Study Director.

L21241-1 to -6

5 May 2014

NARRATIVE

This narrative describes the analysis of sixteen urine samples for selected hydroxy metabolites of poly aromatic hydrocarbons (PAHs) using high-resolution gas chromatography / high-resolution mass spectrometry (HRGC / HRMS).

SAMPLE RECEIPT and STORAGE

The samples were received on 19-March-2014. Details of sample conditions on receipt are provided on the sample receiving record. The samples were stored at -80°C prior to extraction and analysis.

SAMPLE PREPARATION AND ANALYSIS

Analysis procedures were in general accordance with '**AXYS Method 905 Draft: *Analytical Procedure for the Analysis of Hydroxy-Polycyclic Aromatic Hydrocarbons in Urine by HRCG-HRMS.*** A method summary (MSU-905) is included in the data package following this narrative.

The samples were analyzed in batch WG47118, the composition of which is shown on the correlation table, and on the batch list heading the extraction workup sheets. The analysis batch included two procedural blanks, AXYS ID WG47118-101, prepared with synthetic urine, and a pooled control human urine sample, AXYS ID WG47118-102. In addition, two Ongoing Precision and Recovery (OPRs) test samples were included; one, AXYS ID WG47118-103, prepared with spiked synthetic urine and the second, AXYS ID WG47118-105, prepared with spiked human urine.

An accurately measured sub-sample of approximately 4 mL sample was spiked with 30 µL of 2-mercaptoethanol to control analyte oxidation. The samples were then spiked with isotopically labeled quantification standards and ß-glucuronidase enzyme. The mixture was incubated at 37°C for 17 hrs. The de-conjugated analytes were then extracted with pentane. The extracts were reduced under a gentle stream of nitrogen, spiked with the derivatization monitoring standard and the recovery standard and derivatized for 30 min with MSTFA at 60°C with a final volume of 225 µL, 2 µL was injected onto the HRGC/HRMS.

CALCULATIONS

Target concentrations were determined by isotope dilution or internal standard quantification procedures, using OPUSQuan software. Formulas used for conversion of the raw chromatographic data to concentrations are provided in the method summary document, MSU-905.

As described in the method summary, sample specific detection limits (SDLs) were calculated from the noise for each target analyte and used as the detection qualifier. If the OPUSquan software selected an unrepresentative region of noise for the SDL calculation, the SDL is corrected by hand on the raw data.

REPORTING CONVENTIONS

For internal tracking, ARCADIS U.S., INC., was assigned contract number 4765. AXYS logged the samples under the unique laboratory identifier of the form identifier of the form LXXXXX-XX All data reports reference both the client and lab sample identifiers.

Any extra work required and performed after the initial instrumental analysis of a sample extract is given an extra "test suffix" code. The single letter code per extra work performed is added to the AXYS sample ID as a suffix, and is combined with any other applicable test suffix codes. Test code in this data package includes:

i = instrumental reanalysis of the sample extract
W = The sample extract was diluted and instrumentally reanalyzed
N = large dilution, new portion into fresh microvial followed by instrumental analysis

The following data qualifier flags were used in this data package:

D	=	indicates dilution data
K	=	a peak was detected that did not meet all the qualitative criteria for positive identification. The reported value is the estimated maximum possible analyte concentration.
U	=	Analyte not detected
V	=	the recovery of the surrogate falls outside the method control limits
NQ	=	Data not quantifiable, results are not available.

Results are reported to three significant figures, in units of picograms per milliliter (pg/mL).

ANALYTICAL DISCUSSION

The Analyst noted on the laboratory worksheet that sample Day 9 Group 8 (AXYS ID L21236-8) may have been doubly spiked with the labeled quantification standards. The results confirmed the Analyst's note and the reported native analyte concentrations were multiplied by a factor of 2 and the isotope labeled surrogate recovery values were divided by a factor of 2. Data are not affected by this variance.

With the exception of sample Day 7 Group 1, Day 14 Group 1 and Day 14 Group 2 (AXYS ID L21234-1, L21241-1 and -2 respectively) the area responses for multiple analytes were over the calibrated range of the instrument in the original analysis run. The sample extracts were diluted by a factor of up to 20x. The dilution reduced the area responses for the affected analytes, however, results for 3-OH-Chrysene, 3-OH-Benzo[a]pyrene and 9-OH-Benzo[a]pyrene were still slightly over the calibration limit. This was deemed not to significantly affect the reported values.

Due to matrix co-extractives elevated chromatographic noise that resulted in detection limits above 25 pg/mL was observed in four samples namely, Day 7 Group 1, Day 7 Group 2, Day 14 Group 1, and Day 14 Group 2 (AXYS ID L21234-1, -2, L21241-1 samples respectively).

The recoveries of d11-3-OH-Benzo[a]pyrene were observed to be above the upper interim method control limit in multiple samples. This has no impact on the data. The results are recovery-corrected, labeled compound recovery values are provided as general data quality indicators only.

The following quality control samples were included in the analysis workgroup: Two laboratory blanks, one prepared using 4 mL of synthetic urine, and the second prepared using 4 mL of reference human urine. Two ongoing precision and recovery control (OPR) test samples prepared using spiked 4 mL reference human urine and synthetic urine samples.

QA/QC NOTES

The QC samples were prepared alongside the client sample, and were subjected to the same analytical procedures. The sample results were evaluated in comparison to the QC samples.

- The results are not blank corrected. The sample should be compared to the procedural blank.
- By virtue of the isotope dilution/internal standard quantification procedures, data are recovery corrected for possible losses during extraction and cleanup.
- Ion abundance ratios are only used for detection of gross interferences at high concentrations.
- All linearity, CAL/VER, Lab Blank, OPR and labeled compound recovery specifications were met, with the following exception:

- Relative standard deviation for 9-OH-Benzo[a]pyrene were slightly above the interim method acceptance limit of 25% in the initial calibration runs; Data files: MP4B_099 S: 2 to 4 and 7 to 9. Given that both the calibration verification and the OPRs met the method criteria data are not considered affected by this variance. Similarly, %RSD value for d11-3-OH-Benzo[a]pyrene were slightly above the interim method limit value of 35%.

- Cis and Trans 7,8-Diol-Benzo[a]pyrene, were not recovered through the procedure. As a result, the results are flagged with 'NQ'-Not Quantifiable and no data are provided for these analytes.

- With the exception of sample Day 7 Group 1, Day 14 Group 1 and Day 14 Group 2 (AXYS ID L21234-1, L21241-1 and -2 respectively) the area responses for multiple analytes were over the calibrated range of the instrument in the original analysis run. The sample extracts were diluted by a factor of up to 20x. The dilution reduced the area responses for the affected analytes, however, results for 3-OH-Chrysene, 3-OH-Benzo[a]pyrene and 9-OH-Benzo[a]pyrene were still slightly over the calibration limit. This was deemed not to significantly affect the reported values.

- Due to matrix co-extractives detection limits above 25 pg/mL was observed in four samples namely, Day 7 Group 1, Day 7 Group 2, Day 14 Group 1, and Day 14 Group 2 (AXYS ID L21234-1, -2, L21241-1 samples respectively).

- The recoveries of d11-3-OH-Benzo[a]pyrene were observed to be above the upper interim method control limit in the samples listed below and the results have been flagged with a 'V'. This has no impact on the data. The results are recovery-corrected, labeled compound recovery values are provided as general data quality indicators only.

DATA PACKAGE

This data package, assigned a unique identifier DPWG47325, includes: shown on the front page of this Data Package. Included in the data package after the narrative are the following documentations:

- Sample Correlation Table
- Sample Receiving Documentation
- Extraction worksheets.
- Sample data reports
- Laboratory QC data reports
- Instrumental QC data reports (organized by analysis date)
- Sample raw data
- Laboratory QC raw data
- Instrumental QC raw data (organized by analysis date).

I certify that this data package complies with the terms and conditions of the contract, both technically and for completeness, except for the conditions detailed above. In addition, I certify, that to the best of my knowledge and belief, the data as reported are true and accurate. The following signature, on behalf of Axys Analytical Services Ltd, authorizes the release of the data contained in this data package.

Summary of AXYS method MLA-905 Rev. 01 Ver. 01:

ANALYTICAL PROCEDURE FOR THE ANALYSIS OF HYDROXY-POLYCYCLIC AROMATIC HYDROCARBONS IN URINE BY HRGC-HRMS

AXYS Method MLA-905 describes the determination of concentrations of selected hydroxy-polyaromatic hydrocarbons (OH-PAHs) in urine samples. According to clients' requests this analysis may be performed to determine total OH-PAHs (the sum of free OH-PAHs and conjugated OH-PAHs) and/or only free (not conjugated) OH-PAHs. Deconjugation is performed by enzymatic hydrolysis to liberate the glucuronated and sulfonated forms of the analytes into free hydroxy PAH forms.

Typical reporting limits are 10 - 25 pg /mL for each analyte using a 4 mL sample.

TARGET ANALYTES

Hydroxy polycyclic aromatic hydrocarbons (OH-PAHs)

Compound	Short name	CAS #
3-Hydroxy-chrysene	3-OH-Chrysene	63019-39-6
3-Hydroxy-benzo[a]pyrene	3-OH-Benzo[a]pyrene	13345-21-6
9-Hydroxy-benzo[a]pyrene	9-OH-Benzo[a]pyrene	17573-21-6
3-Hydroxy-benz[a]anthracene	3-OH-Benz[a]anthracene	4834-35-9
7,8-Dihydrodiol-benzo[a]pyrene (trans) *	7,8-Diol-benzo[a]pyrene, trans	60864-95-1
7,8-Dihydrodiol-benzo[a]pyrene (cis) *	7,8-Diol-benzo[a]pyrene, cis	60657-25-2

* Poorly recovered analyte, included for general information only

EXTRACTION

Urine samples are spiked with 2-mercaptoethanol to prevent oxidation of the analytes. The samples are then spiked with a suite of labeled quantification standards and labeled derivatization monitoring standard. Where total OH-PAHs (the sum of free OH-PAHs and conjugated OH-PAHs) are required β-glucuronidase enzyme is used to de-conjugate the glucuronated and sulfonated forms of the analytes into free hydroxy PAH forms. The samples are then sequentially extracted with pentane. The extracts are dried with anhydrous sodium sulphate, concentrated and derivatized to trimethylsilyl forms with N-Methyl-N-(trimethylsilyl) trifluoroacetamide.

INSTRUMENTAL ANALYSIS

Instrumental analysis is performed by high-resolution gas chromatography using a 30 m DB-17 capillary column and detection by high resolution mass spectrometry.

Analytes, Typical Retention Times, Acquired Ions and Quantification References

Target Analyte	Typical Retention Time (minutes)	Mass 1	Mass 2	Quantified Against
Target Analytes

Recovery Standard				
$^{13}C_{12}$-PCB-81	16.18	301.9626	303.9597	External standard

CALIBRATION

Initial calibration is performed using a five point calibration series of solutions that encompass the working concentration range. The derivatized initial calibration solutions contain authentic target OH-PAHs, deconjugation monitoring standards, and ^{13}C-labelled or deuterium labelled derivatization monitoring, surrogate and recovery standards. The concentrations of the authentic target compounds in the solutions vary to encompass the working range of the instrument, while the concentrations of the other compounds are constant. Calibration procedures use the mean RRFs determined from the initial calibration to calculate analyte concentrations. Calibration is verified at least once every 12 hours by analysis of a mid-level calibration solution.

Nominal Concentrations of Calibration Standard Solutions

Target analyte	CAL A CS-1	CAL B CS-2	CAL C CS-3	CAL D CS-4	CAL E CS-5	CAL F CAL VER CS-6	CAL G CS-7	CAL H CS-8
3-OH-Chrysene	0.25	0.50	1.00	5.00	50	250	500	1000

ANALYTE IDENTIFICATION

An individual chromatographic peak is identified as a target compound if the following criteria are met for the quantification and confirmation ions:

1. Peak responses must be at least three times the background noise level for the quantification mass ion.
2. Each analyte is identified with one quantification and one confirmation mass ion.
3. The relative retention time must be within the window predicted from the initial calibration runs and the surrogate standard retention times.
4. Peak maxima for quantification and confirmation ions must coincide within two seconds.

QUANTIFICATION

Target concentrations are determined by isotope dilution or internal standard quantification procedures using MassLynx software. The equation used in the conversion of the raw chromatograms to concentration is provided below:

$$\text{Sample Conc.} = \left(\frac{\text{area of Target}}{\text{area of Surro}} \times \text{weight of Surro. (ng)}\right) \text{x} \left(\frac{1}{RRF_X}\right) \text{x} \left(\frac{1}{\text{sample size (mL)}}\right),$$

where RRF_x = Relative Response Factor for the analyte. RRFs are calculated for each analyte according to the following equation:

$$RRF_x = \left(\frac{A_x}{A_{IS}}\right) \times \left(\frac{C_{IS}}{C_x}\right)$$

where: C_{IS} =The concentration of the quantification standard in the calibration standard.
C_x =The concentration of the target analyte in the calibration standard.

Final target concentrations are recovery corrected by this method of quantification.

The recovery of the surrogate standard is calculated (by internal standard quantification against the recovery standard using an average RRF) and monitored as an indication of overall data quality.

$$\text{\% Surrogate recovery} = \left(\frac{\text{area of Surrogate}}{\text{area of Recovery Std}} \times \frac{\text{Weight of Rec. Std}}{\text{Weight of Surro.}}\right) \text{x} \left(\frac{100}{RRF}\right)$$

REPORTING CRITERIA

Sample specific detection limits (SDLs) are calculated by TargetLynx software using 3 times the signal of the noise in the target channel converted to an equivalent sample concentration:

$$\text{SDL} = \left(\frac{\text{3 x Height of Noise}}{\text{Height of Surro}} \times \text{weight of Surro (ng)}\right) \text{x} \left(\frac{1}{RRF_X}\right) \text{x} \left(\frac{1}{\text{sample size (mL)}}\right)$$

SDLs values are used as a detection qualifier. Final concentrations may be reported as picograms per milliliter (pg/mL) or picograms per gram (pg/g). The units to be used for a given project have to be negotiated at the start of every project.

QUALITY ASSURANCE/QUALITY CONTROL

All samples are analyzed in batches with the following composition:

- Batch Size – Each batch consists of test samples and additional QC samples.
- Blanks – Blanks are analyzed with a minimum frequency of 5% of client samples (i.e. each batch of up to 20 client samples contains a procedural blank). A laboratory prepared pooled urine verified for use, e.g., reference urine SC6235 or synthetic urine, is used as the matrix for the laboratory blank. The laboratory blank is also spiked with the de-conjugation monitoring standard.
- Duplicates – Where sufficient sample is available a duplicate sample is normally analyzed with each analysis batch containing greater than six (6) test samples, or as required by contract.
- OPR (Ongoing Precision and Recovery) – OPRs are analyzed with a minimum frequency of 5% of client samples (i.e. each batch of up to 20 client samples contains an OPR.) An aliquot of native standard (typically 10 µL equivalent to 20 ng per analyte) is added to 4 mL of an approved reference urine matrix to prepare the spiked reference sample. The OPR is also spiked with the de-conjugation monitoring standard.
- A Matrix Spike/Matrix Spike Duplicate may be analyzed upon client request.
- Surrogate/Authentic/Recovery (SAR) solution – Standards for OH-PAHs degrade fairly rapidly. As a diagnostic tool of standards stability control SAR must be prepared with each analysis batch and evaluated.

The batch composition may vary according to batch or quality control requirements specified by a client. Each batch is carried through the complete analytical process as a unit. For sample data to be reportable the batch QC data must meet the acceptance criteria.

QC Specification Table: Procedural Blank Levels and OPR Recoveries

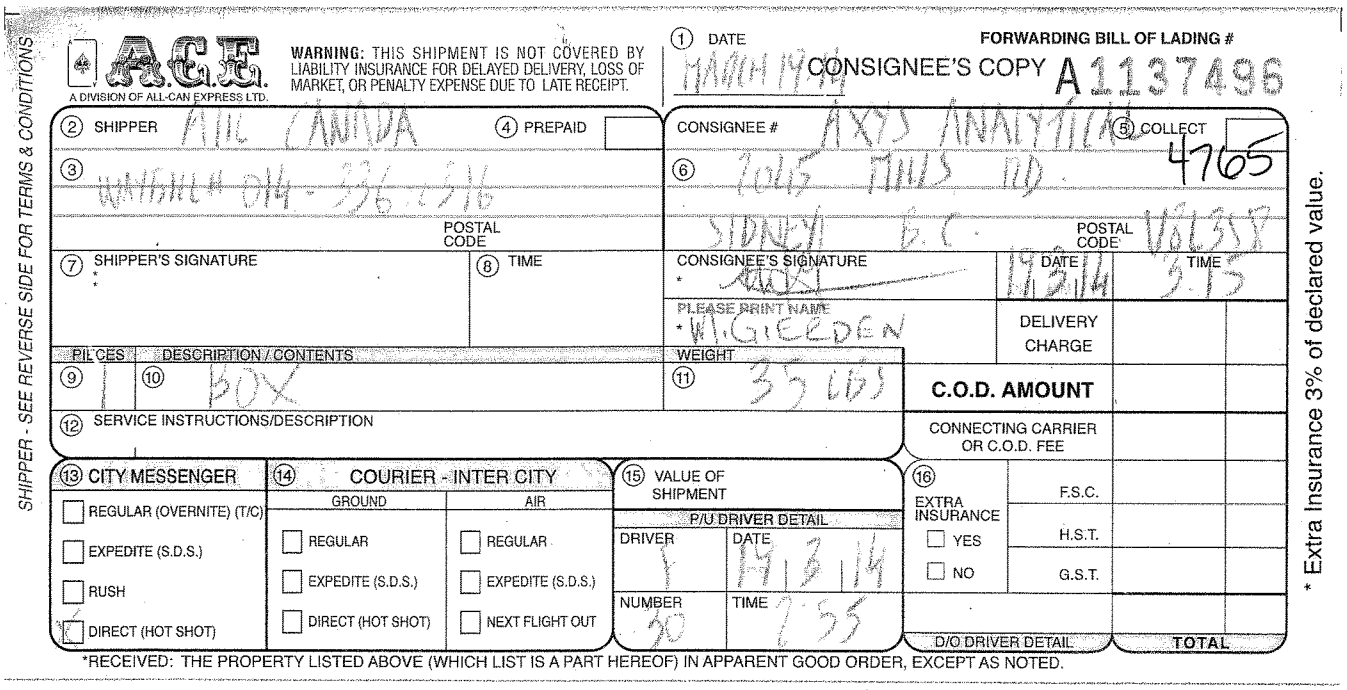
Analyte	Procedural Blank Level pg/sample [1]	Acceptable OPR (% Recovery) [2]
3-OH-Chrysene	100	70-130
3-OH-Benzo[a]pyrene	100	70-130
9-OH-Benzo[a]pyrene	100	60-140
3-OH-Benz[a]anthracene	100	70-130
7,8-Diol-benzo[a]pyrene, Cis *	100	N/A
7,8-Diol-benzo[a]pyrene, Trans *	100	N/A
De-conjugation monitoring standards		
1-OH-Naphthalene	100	50-150
1-OH-Pyrene	100	50-150
Surrogate standards		
$^{13}C_6$-3-OH-Chrysene	50-150	50-150
$^{13}C_6$-1-OH-Benz[a]anthracene	50-150	50-150
d_{11}-3-OH-Benzo[a]pyrene	20-120	20-120
$^{13}C_6$-1-OH-Naphthalene	20-120	20-120
$^{13}C_6$-1-OH-Pyrene	20-120	20-120
Derivatization monitoring standard		
$^{13}C_{12}$-4'-OH-3,3',4,5'-TetraCB	60-140	60-140
Recovery standard		
$^{13}C_{12}$-PCB-81	50-200	50-200

* Unstable analyte, included for general information only.

[1] Interim laboratory background level acceptance limit is 25 pg/mL for a 4 mL sample (i.e.,100 pg abs.)

[2] Method recovery acceptance limits are not fully developed; the values provided are interim acceptance criteria. Results outside of the values shown may be accepted based on professional judgement.

QC Specification Table: Other parameters



QC Parameter	Specification
Instrument Sensitivity	Daily, S:N ≥ 3:1 for all analytes in the lowest calibration standard.
Initial Calibration	Run initially, and as required to maintain calibration verification and instrument sensitivity. Average response factors are used for quantification. RSD must be less than 25% for the native compounds and less than 35% for the labelled compounds.
Continuing Calibration Verification	Run every 12 hrs, quantify against I-CAL. Calculated conc. must be 70-130% of actual. Surrogate recoveries must fall within the limits of the table above.
Instrumental Carryover and Instrument Background	Every Initial Calibration, Cal/Ver, or OPR: < 0.3 % carryover and area response of analytes in instrument blank < 1000 judged following two previous toluene blank injections.
Duplicate Samples or MS/MSD	If conc. > 5 times R.L., RPD < 40% If conc. < 5 times R.L., difference between pairs < R.L.

Million:
I will convey that to Ricerca. Once you receive the samples, keeping with the Pilot Study scope in the Subcontract, you will be running analyses on two time points for each of the eight dosing groups. Please start with Day 14 samples for Groups 1 through 6 and Day 9 samples for Groups 7 and 8. Finally, Day 7 samples will be run for all eight groups. Please hold other urine samples for potential use following receipt of data from these first 14 samples.
Thank you,
Glenn Hoeger

Hi Glenn,

It appears that the samples will get here tomorrow, not today. For next time it may be better to use FedEx. We will give you a call once we have received the samples.

Have a good day.

3-OH-Benz[a]anthracene			0.32	0.47	0.42	0.52	0.52	0.64	0.48	22.7
7,8-Diol-Benzo[a]pyrene, cis					1.57	1.55	1.92	0.96	1.50	26.5
7,8-Diol-Benzo[a]pyrene, trans					1.38	1.79	1.79	1.14	1.52	21.0

(1) Where applicable, custom lab flags have been used on this report.
(2) QC limit is 20% for native compounds with a labeled analog, 35% for those without a labeled analog.

These data are validated and reported as accurate and in accord with AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

3-OH-Chrysene		**316/301**		1.86	1.93	1.92	1.93	1.98	1.99	1.26-2.61
3-OH-Benzo[a]pyrene		**340/325**		10.1	6.81	5.28	4.93	4.78	5.02	4.00-8.30
9-OH-Benzo[a]pyrene		**340/325**		11.7	5.56	6.42	5.82	6.10	6.37	4.54-9.44
3-OH-Benz[a]anthracene		**316/301**		1.75	2.13	2.37	1.97	2.00	2.02	1.33-2.75
7,8-Diol-Benzo[a]pyrene, cis		**191/252**				9.78	9.93	9.03	12.1	5.11-15.3
7,8-Diol-Benzo[a]pyrene, trans		**191/252**				11.9	14.7	11.8	18.1	7.07-21.2

(1) Where applicable, custom lab flags have been used on this report.
(2) QC limits are +/- 20% of the theoretical ion ratios for calibration standards CS2 to CS5, and +/- 50% for calibration standard CS1.

These data are validated and reported as accurate and in accord with AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

ARCADIS U.S., Inc.
401 East Main Street, Suite 400
El Paso, TX 79901

Work Order: **HS15040080**

Laboratory Results for: **Foster AFB Bioavailablity - G3 Extracts and Clean Soil**

Dear Glenn,

ALS Environmental received 17 sample(s) on Apr 01, 2015 for the analysis presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Generated By: Dane.Wacasey

Client: ARCADIS U.S., Inc. **CASE NARRATIVE**
Project: Foster AFB Bioavailablity - G3 Extracts and Clean Soil
Work Order: HS15040080

Work Order Comments

- Samples analyzed outside of the holding time at the request of the client. Results should be considered estimated.

GCMS Semivolatiles by Method SW8270

Batch ID: 92124

- Insufficient sample received to perform MS/MSD. LCS/LCSD provided as batch quality control.

- Samples were extracted and analyzed as client requested. Normal calculations to determine surrogate recovery do not apply.

Client: ARCADIS U.S., Inc.

QUALIFIERS, ACRONYMS, UNITS

Qualifier	Description
*	Value exceeds Regulatory Limit
a	Not accredited
B	Analyte detected in the associated Method Blank above the Reporting Limit
E	Value above quantitation range
H	Analyzed outside of Holding Time
J	Analyte detected below quantitation limit
M	Manually integrated, see raw data for justification
n	Not offered for accreditation
ND	Not Detected at the Reporting Limit
O	Sample amount is > 4 times amount spiked
P	Dual Column results percent difference > 40%
R	RPD above laboratory control limit
S	Spike Recovery outside laboratory control limits
U	Analyzed but not detected above the MDL/SDL

Acronym	Description
DCS	Detectability Check Study
DUP	Method Duplicate
LCS	Laboratory Control Sample
LCSD	Laboratory Control Sample Duplicate
MBLK	Method Blank
MDL	Method Detection Limit
MQL	Method Quantitation Limit
MS	Matrix Spike
MSD	Matrix Spike Duplicate
PDS	Post Digestion Spike
PQL	Practical Quantitaion Limit
SD	Serial Dilution
SDL	Sample Detection Limit
TRRP	Texas Risk Reduction Program

Work Order: **HS15040097**

Laboratory Results for: **Foster AFB Bioavailablity - G2**

Dear Glenn,

ALS Environmental received 15 sample(s) on Apr 01, 2015 for the analysis presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

QUALIFIERS, ACRONYMS, UNITS

Qualifier	Description
*	Value exceeds Regulatory Limit
a	Not accredited
B	Analyte detected in the associated Method Blank above the Reporting Limit
E	Value above quantitation range
H	Analyzed outside of Holding Time
J	Analyte detected below quantitation limit
M	Manually integrated, see raw data for justification
n	Not offered for accreditation
ND	Not Detected at the Reporting Limit
O	Sample amount is > 4 times amount spiked
P	Dual Column results percent difference > 40%
R	RPD above laboratory control limit
S	Spike Recovery outside laboratory control limits
U	Analyzed but not detected above the MDL/SDL

Acronym	Description
DCS	Detectability Check Study
DUP	Method Duplicate
LCS	Laboratory Control Sample
LCSD	Laboratory Control Sample Duplicate
MBLK	Method Blank
MDL	Method Detection Limit
MQL	Method Quantitation Limit
MS	Matrix Spike
MSD	Matrix Spike Duplicate
PDS	Post Digestion Spike
PQL	Practical Quantitaion Limit
SD	Serial Dilution
SDL	Sample Detection Limit
TRRP	Texas Risk Reduction Program

Unit Reported	Description
µg/L	Micrograms per Liter

Laboratory Results for: **Foster AFB Bioavailablity - G4**

Dear Glenn,

ALS Environmental received 15 sample(s) on Apr 01, 2015 for the analysis presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Client: ARCADIS U.S., Inc.
Project: Foster AFB Bioavailablity - G4
Work Order: HS15040100

CASE NARRATIVE

GCMS Semivolatiles by Method SW8270

Batch ID: 92124

Sample ID: **FAFB-Bulk-G4 (Extr.Comp1of3) (HS15040100-12)**
- Sample was analyzed outside of the holding time at the request of the client. Results should be considered estimated.

Sample ID: **LCS-92124**
- Insufficient sample received to perform MS/MSD. LCS/LCSD provided as batch quality control.

Client: ARCADIS U.S., Inc.
Project: Foster AFB Bioavailablity - G4
Sample ID: FAFB-Bulk-G4 (Extr.Comp1of3)
Collection Date: 21-Nov-2014 10:15

QUALIFIERS, ACRONYMS, UNITS

Qualifier	Description
*	Value exceeds Regulatory Limit
a	Not accredited
B	Analyte detected in the associated Method Blank above the Reporting Limit
E	Value above quantitation range
H	Analyzed outside of Holding Time
J	Analyte detected below quantitation limit
M	Manually integrated, see raw data for justification
n	Not offered for accreditation
ND	Not Detected at the Reporting Limit
O	Sample amount is > 4 times amount spiked
P	Dual Column results percent difference > 40%
R	RPD above laboratory control limit
S	Spike Recovery outside laboratory control limits
U	Analyzed but not detected above the MDL/SDL

Acronym	Description
DCS	Detectability Check Study
DUP	Method Duplicate
LCS	Laboratory Control Sample
LCSD	Laboratory Control Sample Duplicate
MBLK	Method Blank
MDL	Method Detection Limit
MQL	Method Quantitation Limit
MS	Matrix Spike
MSD	Matrix Spike Duplicate
PDS	Post Digestion Spike
PQL	Practical Quantitaion Limit
SD	Serial Dilution
SDL	Sample Detection Limit
TRRP	Texas Risk Reduction Program

Unit Reported	Description
µg/L	Micrograms per Liter

Glenn Hoeger
ARCADIS U.S., Inc.
401 East Main Street, Suite 400
El Paso, TX 79901

Work Order: **HS15040110**

Laboratory Results for: **Foster AFB Bioavailablity - G5**

Dear Glenn,

ALS Environmental received 15 sample(s) on Apr 01, 2015 for the analysis presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Generated By: Dayna.Fisher

Client: ARCADIS U.S., Inc. **CASE NARRATIVE**
Project: Foster AFB Bioavailablity - G5
Work Order: HS15040110

GCMS Semivolatiles by Method SW8270

Batch ID: 92125

Sample ID: **FAFB-Bulk-G5 (Extr.Comp1of3) (HS15040110-12)**
- Samples in work order HS15040110 were extracted and analyzed as client requested. Normal calculations to determine surrogate recovery do not apply.

Sample ID: **LCS-92125**
- Insufficient sample received to perform MS/MSD. LCS/LCSD provided as batch quality control.

Sample ID: **LCSD-92125**
- The LCSD RPD criterion was exceeded. Individual recoveries were within criteria.

Client: ARCADIS U.S., Inc.
Project: Foster AFB Bioavailablity - G5

QUALIFIERS, ACRONYMS, UNITS

Qualifier	Description
*	Value exceeds Regulatory Limit
a	Not accredited
B	Analyte detected in the associated Method Blank above the Reporting Limit
E	Value above quantitation range
H	Analyzed outside of Holding Time
J	Analyte detected below quantitation limit
M	Manually integrated, see raw data for justification
n	Not offered for accreditation
ND	Not Detected at the Reporting Limit
O	Sample amount is > 4 times amount spiked
P	Dual Column results percent difference > 40%
R	RPD above laboratory control limit
S	Spike Recovery outside laboratory control limits
U	Analyzed but not detected above the MDL/SDL

Acronym	Description

Work Order: **HS15060424**

Laboratory Results for: **Foster AFB Bioavailablity Dermal Study**

Dear Glenn,

ALS Environmental received 4 sample(s) on Jun 10, 2015 for the analysis presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

QUALIFIERS, ACRONYMS, UNITS

Qualifier	Description
*	Value exceeds Regulatory Limit
a	Not accredited
B	Analyte detected in the associated Method Blank above the Reporting Limit
E	Value above quantitation range
H	Analyzed outside of Holding Time
J	Analyte detected below quantitation limit
M	Manually integrated, see raw data for justification
n	Not offered for accreditation
ND	Not Detected at the Reporting Limit
O	Sample amount is > 4 times amount spiked
P	Dual Column results percent difference > 40%
R	RPD above laboratory control limit
S	Spike Recovery outside laboratory control limits
U	Analyzed but not detected above the MDL/SDL

Acronym	Description
DCS	Detectability Check Study
DUP	Method Duplicate
LCS	Laboratory Control Sample
LCSD	Laboratory Control Sample Duplicate
MBLK	Method Blank
MDL	Method Detection Limit
MQL	Method Quantitation Limit
MS	Matrix Spike
MSD	Matrix Spike Duplicate
PDS	Post Digestion Spike
PQL	Practical Quantitaion Limit
SD	Serial Dilution
SDL	Sample Detection Limit
TRRP	Texas Risk Reduction Program

Unit Reported	Description
µg/Kg	Micrograms per Kilogram

Summary

The objective of this study was to provide urine samples to the Sponsor to test methods for analyzing the presence of metabolites of polycyclic aromatic hydrocarbons in urine.

Introduction

This study is the main study associated with a previous pilot study, Ricerca Study 030947, titled “Fourteen-Day Diet Mix Pilot Study of Soil and Clay Target and Soil and Clay Target Extracts in Mice”.

Methods

Ninety-six female B6C3F1 mice, 8 per group, were assigned to 12 groups as shown in the table below. Mice were housed together (4 mice/cage) in metabolism cages (2 cages/Group) to allow for daily collection of pooled urine. Animals received an NIH-31 dietary admixture containing the test articles at the levels shown in the table below. The dose levels (ppm) were calculated based on the measured benzo(a)pyrene (BaP) in each respective lot of test article used. These diets were administered to the mice for 14 consecutive days. The mice were observed for viability twice daily throughout the study. Individual animal body weights were taken daily during the dosing period, and food consumption per cage (divided by four to obtain an average food consumption per animal) was measured daily during the dosing period. The first day of administration was designated as Day 1 of the study. There were no unscheduled deaths on study.

Group Assignment and Dose Levels

Dose Group	Number of Animals (Female)	Test Article	Test Article Lot Number	Dose Level	
1	8*	Sieved soil to 250 µM negative control	HS150400780-17	5% (w/w) of diet	
2	8	Benzo(a)pyrene (B(a)P) Positive control	SLBG9477V	25 ppm	
3	8	Sieved Soil	HS15040099	0.22 ppm	5% (w/w) of diet
4	8	Sieved Soil	HS15040097	9.17 ppm	
5	8	Sieved Soil	HS15040080	1.42 ppm	
6	8	Sieved Soil	HS15040100	0.03 ppm	
7	8	Sieved Soil	HS15040110	0.01 ppm	
8	8	Extract of Group 3 Sieved Soil	FAFB-G1	0.22 ppm	
9	8	Extract of Group 4 Sieved Soil	FAFB-G2	9.17 ppm	
10	8	Extract of Group 5 Sieved Soil	FAFB-G3	1.58 ppm	
11	8	Extract of Group 6 Sieved Soil	FAFB-G4	0.03 ppm	
12	8	Extract of Group 7 Sieved Soil	FAFB-G5	0.01 ppm	

*All groups of 8 animals were split into two cages of four animals per cage.

Results and Discussion

Consumption of feed containing nominal concentrations of BaP, as well as several other polycyclic aromatic hydrocarbons (PAHs), had no detectable adverse effects on the animals.

Mixtures of animal diet with soil or extracts of soil were analyzed by ALS life Sciences and AXYS Analytical Service. Only Groups 2, 4, 5, 9, and 10 were analyzed at ALS, while AXYS analyzed samples from all diets prepared. ALS analytical results could not meet precision requirements with too much variation between top, middle, and bottom samples and results could not meet accuracy requirements consistently reporting concentrations much lower than nominal concentrations. Analytical results from AXYS on the Group 2 samples diet spiked with BaP, showed low variability between top, middle, and bottom samples and were 13% lower than nominal. These results demonstrate that the methodology for preparing B(a)P-spiked diet is capable of producing diets at a desired concentration. Analytical results from AXYS for top, middle, and bottom samples of all groups showed a much reduced variability that were well within project limits compared to ALS results for the same samples. Averages of the top, middle, and bottom samples were sometimes lower and sometimes higher than nominal concentrations. Percent variance from the target ppm ranged from by 10% to 109%; however, the larger variances were all related to sieved soil diets where analytical data from ALS was biased low.

Daily pooled urine volumes from four animals ranged from as low as 1.0 mLs to as high as 43.8 mLs. Examination of urine in collection cups did not reveal any evidence of contamination of the urine with feces on any collection day.

Conclusion

The diet mix analytical results from ALS were highly variable indicating issues with the analytical method. These data are presented but at the request of the Sponsor are not used for evaluating the diet mix methodology. These data were also not considered indicative of PAH levels to which mice on study were exposed.

The diet mix analytical results from AXYS are much less variable, within an acceptable variance from target concentrations, and indicate that the methodology for diet formulation by mixing PAH-containing soil with animal diet is capable of producing diet at a desired concentration.

Exposure of mice through the diet to nominal levels of BaP up to 19.17 ppm did not have detectable adverse effects on the animals.

Schedule of Events

Study Initiation:	15-Apr-2015
Experimental Start:	20-Apr-2015
First Day of Dosing:	12-May-2015
Last Day of Dosing:	25-May-2015
Experimental Completion:	10-Jun-2015

Regulatory Compliance

This non-GLP study was performed according to the protocol and testing facility standard operating procedures.

Test Article and Positive Control

Identification	Test Articles - Sieved soil and extracts in methylene chloride. Positive Control - Benzo(a)pyrene B(a)P

Lot Numbers	HS150400780-17: Clean Soil Sample (Group 1) SLBG9477V: Benzo(a)pyrene B(a)P (Group 2) Soil Test Articles (Groups 3-7) Group 3: HS15040099 Group 4: HS15040097 Group 5: HS15040080 Group 6: HS15040100 Group 7: HS 15040110 Soil Test Article Extract (Group 8-12) Group 8: FAFB-G1 Group 9: FAFB-G2F Group 10:FAFB-G3 Group 11:FAFB-G4 Group 12:FAFB-G5
Purity/Correction Factor	Test articles and positive control were used without a correction factor
Bulk Stability	Information about bulk stability of either the test articles or positive control was not provided
Storage Conditions	Positive control was stored at ambient room temperature. Test article was stored refrigerated at a target temperature of 2-8 °C.
Characteristics	Information that defined the test article or positive control articles was supplied by the Sponsor/manufacturer and is located in Appendix A.
Safety	An MSDS was provided for the BaP. Specific laboratory safety procedures, included appropriate PPE, were employed when working with the positive control and test articles.
Retention Sample	No retention sample was collected.
Accountability	Maintained according to testing facility SOPs

Disposition	Twenty grams of remaining test articles were transferred to CRL UK for use on study prior to finalization of the study report (see deviation in Appendix C). The remaining test article was shipped to a representative of the United States Navy at: ATTN: Receiving Officer N66001 SPAWARSYSCEN Pacific 4297 Pacific HWY, BLDG 7 MF: Kara Sorensen 553-1340 San Diego, CA 92110. The positive control article purchased by Ricerca from a commercial supplier, the powdered B(a)P, was retained by Ricerca for possible future use on another study.

Vehicle Components

Identification	No vehicle to be used. The sieved soil, extracts, or B(a)P were mixed directly into the diet.

Dose Formulation

Preparation Timeline	The diet preparation (mixing of soils, extracts, and commercially supplied BaP with rodent diet) was performed on 15-April-2015. Samples from this initial preparation were sent to ALS Environmental for analysis on 16-April-2015. The Ricerca Study Director received partial analytical results on 1-May-2015. These diets were re-mixed at the request of the Sponsor on 4- and 5-May-2015. The re-mixed diets were sampled and 20-gram samples were sent to AXYS for analysis on 11-May-2015.
Procedures - General	Documented concentrations of B(a)P in soil and extract were used to calculate PAH concentration in diet preparation (i.e. – BaP concentration was to

be the proxy for PAH concentration).

All calculations used to prepare diets were provided to the Sponsor Contact for verification prior to diet preparation. Due to a calculation error the Group 10 extract was prepared at a nominal concentration of 1.58 ppm rather than 1.42 ppm, see deviation in Appendix C. Diet preparation proceeded following approval of all calculations by Sponsor.

Duration of mixing for each diet of each group was recorded and was a minimum of 15 minutes.

Care was taken not to grind or otherwise crush soil test articles during mixing.

Procedures – General Instructions for Each Group

Sieved soil control test article (Group 1):

The appropriate amount of test article was incorporated into the remaining amount of meal for that batch in a plastic bag.

Positive control test article (Group 2):

Thirty milligrams of BaP was added to 88 mL methylene chloride and mixed. The resulting mixture was added to 60 grams of NIH-31 diet. After thorough mixing and evaporation of any methylene chloride, these 60 grams were added to 1,140 grams of NIH-31 diet and thoroughly mixed for at least 15 minutes. Thirty milligrams of BaP in 1.2 kg equaled a nominal BaP concentration of 25 mg/kg/25 ppm (30 mg/1.2 kg = 25 mg/kg).

Sieved soil test article (Groups 3-7):

For Groups 3 to 7, each group received a different lot of sieved soil. The appropriate amounts of test article were incorporated into the remaining amount of meal for that batch in a plastic bag.

Extract test article (Groups 8-12):

For Groups 8 to 12, each group received an extract from a different lot of sieved soil. The extracts in Groups 8-12 corresponded with the soil samples used on Groups 3 to 7. The extract test article was initially incorporated into diet by applying a predetermined volume of extract in

	methylene chloride directly to approximately 60 grams of rodent meal using a beaker and mixing spoon. The methylene chloride was allowed to evaporate from the diet under a hood. The 60 grams of prepared diet, considered a "Stock diet", was mixed in a plastic bag with the remaining amount of meal for that batch to achieve the 5% (by weight) Soil Test Article diet concentration for B(a)P.
Storage Conditions	Test article and positive control diets to be stored refrigerated at 2-8 °C.
Soil Samples Shipped to the United Kingdom	The Sponsor requested on 11-May-2015 that 20-gram samples of the soil used on this study be provided to Charles River United Kingdom (CRL UK) for their use on a toxicity study. The following seven samples of approximately 20 grams were shipped from Ricerca to CRL UK: 1. Clean Soil Test Article (HS150400780-17) 2. G-1 Soil Test Article (HS15040099) 3. G-2 Soil Test Article (HS15040097) 4. G-3 Soil Test Article (HS15040080) 5. G-4 Soil Test Article (HS15040100) 6. G-5 Soil Test Article (HS 15040110) 7. Clean Soil Spiked w/ 25 ppm Benzo(a)pyrene (HS150400780-17) The following was completed to produce item number 7, the soil spiked with BaP: • 2.5 mg of BaP was added to 147 mL methylene chloride to make a 0.017 mg/mL solution. After mixing, 30 mL methylene chloride was added to 20 g of HS150400780-17 soil (30 mL of 0.017 mg/mL solution contains 0.51 mg BaP: 30 mL x 0.017 mg/mL 0.51 mg. After thorough mixing and evaporation of any methylene chloride, this 20 g was a nominal BaP concentration of 25 mg/kg/25 ppm (0.5 mg/0.02 kg = 25 mg/kg).

Sample were shipped on ice packs to:

Test Item Controller
Tranent,
Edinburgh
EH33 2 NE
UK

See deviation in Appendix C.

Diet Formulation Analysis

Concentration and Homogeneity

The concentration was determined for each test diet prepared. Prior to analysis, these samples were stored under monitored refrigerated conditions at a target of 2-8 °C. The initial set of duplicate samples was collected (approximately 30 g each for initial samples collected) from the top, middle, and bottom of each test diet preparation.

One set of the initial concentration samples was shipped on 16-Apr-2015 with ice packs to the Contributing Scientist at ALS Environmental, Houston TX, as shown in the Dose Formulation Analysis (see deviation in Appendix C).

Day -7 Re-Mix - All the initial back-up diet formulation analysis samples were added back to the diet for remixing (see deviation in Appendix C).

Day -1 Sample Collection for Additional Diet Formulation Analysis - The diet remix set of duplicate samples was collected (approximately 20 g each sample) from the top, middle, and bottom of each test diet preparation (see deviation in Appendix C).

One set of the diet remixed concentration samples was shipped on 11-May-2015 with ice packs to the Contributing Scientist at AXYS Analytical Services for Dose Formulation Analysis (see deviation in Appendix C). The back-up set from the diet remix sample collection was retained at a controlled temperature of 2-8 o°C as a backup at the Testing Facility and discarded after satisfactory results were obtained on the first set of samples.

Stability	Stability testing was not performed.
General	Results from formulation analyses were included in a dose formulation report located in Appendix B. All remaining dose formulations were properly discarded when the final dose formulation report was issued.

Test System

Humane Care of Animals

Treatment of the animals (including but not limited to all husbandry, housing, and feeding conditions) were conducted in accordance with the guidelines recommended in Guide for the Care and Use of Laboratory Animals (National Academy Press, Washington DC, 2011).

Species	mus musculus
Strain	B6C3F1
Source	Charles River Laboratories, Raleigh, NC
History	The animals were experimentally naïve.
Weight at Initiation of Dosing	21.5-28.3 g, see deviation in Appendix C.
Age at Initiation of Dosing	19.7 weeks of age
Number and Sex	96 females, plus 14 extra
Identification	An ear tag with a matching cage card was used.
Justification	Mice are commonly used in safety evaluation studies that are accepted by appropriate regulatory agencies. The total number of animals used in this study was the minimum required to properly achieve study objectives. This determination was based on historically established conventions in the industry for this type of study.

Receipt and Acclimation	Animals were received from their source and acclimated to the facility and husbandry conditions according to Facility SOPs. Prior to release to study, health status of the animals was reviewed by a member of the veterinary staff. Data collected for animals prior to release to study were maintained as facility records.
Housing/ Sanitation	Upon receipt, animals were housed singly and in stainless steel wire bottom cages. Following randomization, mice were housed together in Nalgene® metabolism cages (4 mice/cage, 2 cages/Group) from Day -20 to Day -13. Due to delays in the start of dosing, animals were returned to stainless steel wire bottom cages and housed singly from Day -13 to Day 1. On Day 1 animals were returned to group housing (4 mice/cage, 2 cages/Group) in Nalgene® metabolism cages (see deviation in Appendix C). Animal room and cage cleaning was performed according to testing facility SOPs.
Diet	Certified Harlan Teklad Global Diet® 2016CM meal was available *ad libitum* from the day of arrival to Day -30. On Day -30, animals were switched to certified Harlan NIH-31 #7017diet as meal, available *ad libitum* until Day -16. From Day -16 to Day -9, the animals were switched back to the Certified Harlan Teklad Global Diet® 2016CM meal, available *ad libitum*. On Day -9, the animals were switched back to certified Harlan NIH-31 #7017diet as meal, which was available *ad libitum* for the remainder of the study (see deviation in Appendix C). Analysis of diet was performed by the manufacturer and the feed was certified to be within specifications.
Water	Tap water filtered through a 0.22-µM PES filter was available *ad libitum* while mice were in their home cages. Water, prior to filtering, was supplied by the City of Painesville and is routinely analyzed to monitor chemical and bacterial levels and to determine priority pollutants.

Contaminants	Results of the food and water analyses are reviewed periodically by a staff veterinarian or designee. No contaminants were known to be present in the food or water that could interfere with the results of the study.
Environment	Temperature: 68 – 79 °F (20 – 26 °C) Humidity: 30 – 70% Light: An alternating 12-hour light/dark cycle was maintained, except during study-specific procedures. Addition or loss of time due to Daylight Savings time adjustments was not considered a deviation. Ventilation: The airflow was set for at least 10 air changes per hour with 100% fresh air (no air recirculation). The environmental conditions of the animal room were monitored and documented.
Environmental Enrichment	Species-specific enrichment was provided per facility SOPs.
Animal Care and Use Statement	The research described did not unnecessarily duplicate previous animal experiments and was conducted in the absence of acceptable nonanimal alternatives to accomplish its objectives. The protocol and any amendments or procedures involving the care or use of animals in this study were reviewed and approved by Ricerca's Institutional Animal Care and Use Committee (IACUC) prior to the initiation of such procedures (i.e., prior to the start of the study for most protocol-specified procedures).

Study Design

Randomization	Animals considered healthy and acceptable for study were assigned to Study Groups using a computer-generated randomization procedure based on body weight. Randomization into study groups occurred on Day -22, see deviation in Appendix C. Animals not assigned to study groups were allocated into a spare group. Spare animals were released from study on Day 2.
Predose	Animals were acclimated to the study room for a minimum of 7 days prior to initiation of dosing. Animals deemed unfit to receive test or control article based on predose data (including behavioral issues) were removed from the study group and replaced by a spare animal. Details about animal replacements are located in Table 1. Predose data collected for selection of animals to be randomized to study were maintained in the study files.
Treatment Groups and Dose Administration	The mice were assigned to groups as shown in the table below. The first day of administration was designated as Day 1 of the study.

Group Assignment and Dose Levels

Dose Group	Number of Animals (Female)	Test Article	Test Article Lot Number	Dose Level	
1	8*	Sieved soil to 250 µM negative control	HS150400780-17	5% (w/w) of diet	
2	8	Benzo(a)pyrene (B(a)P) Positive control	SLBG9477V	25 ppm	
3	8	Sieved Soil	HS15040099	0.22 ppm	5% (w/w) of diet
4	8	Sieved Soil	HS15040097	9.17 ppm	
5	8	Sieved Soil	HS15040080	1.42 ppm	
6	8	Sieved Soil	HS15040100	0.03 ppm	
7	8	Sieved Soil	HS15040110	0.01 ppm	
8	8	Extract of Group 3 Sieved Soil	FAFB-G1	0.22 ppm	
9	8	Extract of Group 4 Sieved Soil	FAFB-G2	9.17 ppm	
10	8	Extract of Group 5 Sieved Soil	FAFB-G3	1.58 ppm	
11	8	Extract of Group 6 Sieved Soil	FAFB-G4	0.03 ppm	
12	8	Extract of Group 7 Sieved Soil	FAFB-G5	0.01 ppm	

*All groups of 8 animals were split into two cages of four animals per cage.

Dose Administration

Dose Administration	Animals received the test or positive control articles mixed in their diet for 14 consecutive days. All animals were terminated the day following completion of dosing.
Route of Administration	All administrations were given by the oral route as a diet admixture.
Justification of Route	This administration route is consistent with the route of exposure used in “Technical Report for Experiment No. 6722: Chronic Bioassay of Two Composite Samples From Selected Manufactured Gas Plant Waste Sites”, Beland and Culp, 1998.
Justification of Dose Levels	Dose levels were selected by the Study Director in agreement with the Sponsor and based on available data including a previously performed pilot study Ricerca # 030947.
Justification of Frequency	The frequency of administration is conventional for studies of this type.

In-Life Observations and Measurements

Clinical Observations	Animals were observed once in the morning and once in the afternoon, at least 4 hours apart, throughout the study. Clinical observations were performed and recorded at approximately the same time each day.
Detailed Clinical Observations	Detailed clinical observations were performed prior to randomization (Day -22).
Body Weights	Body weights were measured predose (Day -22 through -14, and -11) to monitor animal body weights. Additional body weights were measured prerandomization (Days -8, see deviation in Appendix C), and daily for the remainder of the in-life period (Days 1-15).
Food Consumption	Quantitatively, at least once predose, and daily for the remainder of the in-life. Food consumption per cage was divided by four to obtain average food consumption per animal.
Observations for Potential Fecal Contamination	Twice-daily observations of the urine collection cups were performed with the exception of Day 1, on which only one observation was conducted for potential fecal contamination in the pm following the start of dosing. No fecal contamination of collected urine was observed. Pictures were taken daily of pooled urine following transfer to containers used for storage and shipping.

Urine Collection

Sample Collection

Subsequent to the initiation of dosing, daily urine collections were made from each cage. At each collection, urine volume was measured and documented. Urine samples were placed in a freezer set to maintain ≤-70 °C, in prelabeled urine collection vials, until shipment to the analytical lab on Day 15, see deviation in Appendix C.

Frozen samples were shipped on dry ice.

The volume of urine collected each day from each cage was recorded and reported.

Urine Analysis

The results of the bioanalytical analysis of urine by AXYS Analytical Services are reported separately.

Euthanasia/Necropsy

Scheduled Necropsy

Following collection of the final in-life samples, all animals were euthanized by CO_2 overdose and their carcasses were frozen and retained by Ricerca before being appropriately discarded.

Major Computer Systems/Software

The computer systems used on this study may have included, but were not limited to, the following systems. All version numbers of the applications, as well as validation or qualification status, are maintained by Ricerca Biosciences, LLC, and are presented in the table below.

Application Name	Version	Function
Siemens REMs Infocenter[v]	1.6	Archiving and reporting environmental records
Siemens REMs Insight[v]	3.9	Environmental data collection, monitoring and alarming of critical environments
Edstrom Watchdog[v]	5.20	Monitors and records environmental data in vivarium
WinNonLin[v]	6.2	Pharmacokinetic analysis system
Provantis[v]	8.4.2.0	In-life test system data and statistical evaluation
Microsoft Office	NA	Collection of word processing and spreadsheets used for report production
RATS	NA	In-house system used to schedule study activities
SAS[v]	9.1.3	statistical analysis of data within Provantis system
[v]Validated		

Records

Following completion of the study, the protocol, amendment, final report, and all hard copy data, generated at Ricerca Biosciences, LLC were shipped to the Sponsor.

Following completion of analysis and prior to completion of the final report, all remaining samples (including but not limited to biological and formulation samples) were properly discarded.

External test sites were responsible for archiving data produced at their own sites.

Statistical Analysis

When appropriate, numeric animal data were evaluated statistically. For descriptive statistics, means and standard deviations were calculated. For comparative statistics, body weight and body weight gain data were considered to be parametric (continuous data, typically with normal distributions) and were evaluated by analysis of variance (ANOVA) with $p \leq 0.05$. If significance existed, pairwise comparisons of each dose group with the control group were made using a *post hoc* test, Dunnett ($p \leq 0.05$), to identify statistical differences between each dose level group and control values. Comparisons were made within common time points.

Comparative statistics were not conducted for food consumption and urine data because the data was collected by cage, not individual animal.

Results and Discussion

Dose Analysis

Dose Analysis: Appendix B

Approximate 30-gram diet samples were collected from the top, middle, and bottom of each of the diet test groups prepared on 15-Apr-2015. Samples were sent to ALS Environmental to perform analyses of PAH concentrations to confirm the calculated dose levels and the consistency of diet preparation. The principal analyte of interest was BaP. Initial results received from ALS for Groups 2, 4, 5, 9, and 10 were highly variable and several analytical issues were encountered. These variable results and analytical issues prompted a search for an alternate lab to conduct the diet mix analytical work. AXYS Analytical Service, LTD (also performing the urine analysis for this study) was determined to be a suitable alternate lab. Therefore, on 4- and 5-May-2015, the diets prepared on 15-Apr-2015 were re-mixed for an additional 15 minutes, and approximate 20-gram samples of these re-mixed diets were collected and sent to AXYS Analytical Services for analyses of PAH concentrations with the principal analyte of interest being BaP.

The concentrations of B(a)P from the ALS and AXYS analyses are presented in the tables on the following pages and are discussed immediately below.

ALS Results from Groups 2, 4, 5, 9, and 10

Analytical results from top, middle, and bottom samples of Groups 2, 4, and 9 at ALS were highly variable not meeting project precision goals, while Group 5 and 10 results showed less variability between top, middle, and bottom. Averages of the top, middle, and bottom samples in all cases were lower than nominal concentrations with the percent lower ranging from by 23% to 69%.

AXYS Results From All Dose Groups

Analytical results from top, middle, and bottom samples of all groups at AXYS showed a much reduced variability between top, middle and bottom samples compared to ALS results for the same samples. Averages of the top, middle, and bottom samples were sometimes lower and sometimes higher than nominal concentrations. Percent variance from the targt ppm ranged from by 10% to 105%; however, the larger variances were all related to sieved soil diets where analytical data from ALS was biased low.

ALS Analysis Results				
Group	**Replicate**	**Benzo(a)pyrene (ppm)**	**Average (ppm)**	**Target (ppm)**
Group 1 (Sieved soil negative control)	Results not available			
Group 2 (Benzo(a)pyrene [B(a)P] positive control)	Top	7.6	9.80	25
	Middle	13.0		
	Bottom	8.8		
Group 3 (Sieved Soil)	Results not available			
Group 4 (Sieved Soil)	Top	7.1	3.52	9.17
	Middle	2.5		
	Bottom	0.95		
Group 5 (Sieved Soil)	Top	1.3	1.13	1.42
	Middle	1.1		
	Bottom	1.0		
Group 6 and 7 (Sieved Soils)	Results not available			
Group 8 (Group 3 Extract)	Results not available			
Group 9 (Group 4 Extract)	Top	2.6	2.87	9.17
	Middle	4.6		
	Bottom	1.4		
Group 10 (Group 5 Extract)	Top	1.1	0.94	1.58*
	Middle	0.89		
	Bottom	0.84		
Group 11 and 12 (Group 6 and 7 Extract, respectively)	Results not available			

*Calculation error, should have been 1.42 based off of Group 5 ppm.

*BLQ - Concentration less than lowest calibration equivalent; **Calculation error, should have been 1.42 based off of Group 5 ppm.

Mortality

There were no unscheduled deaths on study.

Observations

Summary of Observations by Group: Table 2
Summary of Observations by Day: Table 3
Individual Observations: Table 10

Hair loss in a few animals of each group was the only clinical observation on study. This finding was noted in all animals prior to the initiation of dosing and was not considered related to test article exposure.

Observations for Potential Fecal Contamination

Potential Fecal Contamination: Table 4

Fecal pellets were not observed in the urine collection cups at any time on study.

Body Weights

Mean Body Weights: Table 5
Mean Daily Body Weight Gain: Table 6
Mean Cumulative Body Weight gain: Table 7
Individual Body Weights: Table 11
Individual Daily and Cumulative Body Weight Gain: Table 12

Body weight and body weight gain were not altered by exposure to test article.

Food Consumption

Mean Food Consumption: Table 8
Individual Food Consumption: Table 13

Group mean food consumption in all groups was similar to Group 1 throughout the dosing period. Food consumption was not altered by exposure to test article.

Urine Volume

Urine Volume by Cage: Table 14

The volume of urine collected each day from each cage of four animals varied widely, ranging from as low as 1.0 mL to as high as 43.8 mL.

Urine Analysis

The results of the bioanalytical analysis of urine by AXYS Analytical Services are reported separately and not include in this report.

Conclusion

The diet mix analytical results from ALS were highly variable indicating issues with the analytical method. These data are presented but at the request of the Sponsor are not used for evaluating the diet mix methodology. These data were also not considered indicative of PAH levels to which mice on study were exposed.

The diet mix analytical results from AXYS are much less variable, within an acceptable variance from target concentrations, and indicate that the methodology for diet formulation by mixing PAH-containing soil with animal diet is capable of producing diet at a desired concentration.

Exposure of mice through the diet to nominal levels of BaP up to 19.17 ppm did not have detectable adverse effects on the animals.

Table 1: Reassignment of Animals

Original Animal	Group	Sex	Replacement Animal	Original Assignment	Date of Replacement	Cause of Replacement
298469	7	F	298511	Spare	5/7/2015	Animal was crushed while closing cage after AM clinical observation on Day -5.
298495	11	F	298510	Spare	5/5/2015	Animal was missing from cage and found dead outside of animal room on Day -7.

Certificate of Analysis

Product Name:
Benzo[a]pyrene – ≥96% (HPLC)

Product Number:	**B1760**
Batch Number:	**SLBG9477V**
Brand:	SIGMA
CAS Number:	50-32-8
MDL Number:	MFCD00003602
Formula:	C20H12
Formula Weight:	252.31 g/mol
Quality Release Date:	31 MAY 2013
Recommended Retest Date:	MAY 2017

Test	Specification	Result
Appearance (Color)	Light Yellow to Yellow-Green, Yellow-Orange	Yellow
Appearance (Form)	Powder	Powder
Solubility (Color)	Light Yellow to Yellow-Green, Yellow-Orange	Yellow
Solubility (Turbidity) 50 mg/mL, CHCl3	Clear	Clear
Purity (HPLC)	≥ 96 %	97 %

Certificate of Analysis **Page 1 of 1**

Fisher Scientific

1 Reagent Lane
Fair Lawn, NJ 07410
201.796.7100 tel
201.796.1329 fax

Certificate of Analysis

Fisher Scientific's Quality System has been found to conform to Quality Management System Standard ISO9001:2008 standard by SAI Global Certificate Number CERT - 0064970

This is to certify that units of the above mentioned lot number were tested and found to comply with the specifications of the grade listed. Certain data have been supplied by third parties. Fisher Scientific expressly disclaims all warranties, expressed or implied, including the implied warranties of merchantability and fitness for a particular purpose. Certain products (USP/FCC/NF/EP/BP/JP grades) are sold for use in food, drug, or medical device manufacturing. Fisher does not claim regulatory coverage under 21 CFR nor maintain DMF's with the FDA. The following are the actual analytical results obtained:

Catalog Number	**D37**	**Quality Test / Release Date**	**8/20/2013**
Lot Number	**135146**		
Description	**METHYLENE CHLORIDE, A.C.S.**		
Country of Origin	**United States**	*** Suggested Retest Date**	**Aug-2018**
Chemical Origin	**Organic - synthetic**		
BSE/TSE Comment	Methylene Chloride is made from hydrocarbon feedstocks and chlorine, and never comes into contact with materials of animal origin. Therefore, there is no issue with BSE/TSE with this product.		
Chemical Comment	This product contains no genetically modified materials and is free of any known allergy-stimulating food substances. Melamine is not used in the manufacture or processing of this product, nor is there a credible chemical route for its formation. While it is not analyzed for melamine, there is no reason to believe that there is any melamine in this product.		

Result name	Units	Specifications	Test Value
APPEARANCE		REPORT	CLEAR COLORLESS LIQUID
ASSAY	%	>= 99.5	99.9
COLOR	APHA	<= 10	5
DENSITY AT 25 DEGREES C	GM/ML	Inclusive Between 1.315 - 1.321	1.316
EVAPORATION RESIDUE	%	<= 0.002	<0.0002
FREE HALOGENS	PASS/FAIL	= PASS TEST	PASS TEST
IDENTIFICATION	PASS/FAIL	= PASS TEST	PASS TEST
TITRATABLE ACID	mEq/g	<= 0.0003	0.00009
WATER (H2O)	%	<= 0.02	0.002

Edgar E. Hess

Lab Manager BPF

Note: The data listed is valid for all package sizes of this lot of this product, expressed as a extension of this catalog number listed above. If there are any questions with this certificate, please call Chemical Services at (800) 227-6701.
*Based on suggested storage condition.

Date: 4/16/15

From: Tammy Taylopr

The enclosed shipment was shipped on ice packs and contains a total of 37 samples for analysis from Ricerca Study 031705. Please review the included Sample Index Transfer Form upon receipt.

Please electronically return signed copies of this letter and Sample Index Transfer Form upon the arrival of this shipment.

Sincerely,

Tammy Taylor

Use of this system constitutes your agreement to the service conditions in the current FedEx Service Guide, available on fedex.com. FedEx will not be responsible for any claim in excess of $100 per package, whether the result of loss, damage, delay, non-delivery, misdelivery, or misinformation, unless you declare a higher value, pay an additional charge, document your actual loss and file a timely claim. Limitations found in the current FedEx Service Guide apply. Your right to recover from FedEx for any loss, including intrinsic value of the package, loss of sales, income interest, profit, attorney's fees, costs, and other forms of damage whether direct, incidental, consequential, or special is limited to the greater of $100 or the authorized declared value. Recovery cannot exceed actual documented loss. Maximum for items of extraordinary value is $1,000, e.g. jewelry, precious metals, negotiable instruments and other items listed in our Service Guide. Written claims must be filed within strict time limits, see current FedEx Service Guide.

After printing this label:
CONSIGNEE COPY - PLEASE PLACE IN FRONT OF POUCH
1. Fold the printed page along the horizontal line.
2. Place label in shipping pouch and affix it to your shipment.

(1) Where applicable, custom lab flags have been used on this report; U = not detected at RL; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration; J = concentration less than lowest calibration equivalent.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = contract defined limit.
(3) May co-elute with Cyclopenta(cd)pyrene.
(4) May co-elute with Triphenylene.
(5) May co-elute with Dibenz[a,c]anthracene.

These data are validated and reported as accurate and in accord with AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

BATCH SUMMARY

Batch ID: WG51242	***Date:*** 10-Jun-2015
Analysis Type: PAH	***Matrix Type:*** Tissue

BATCH MAKEUP

Contract: 4765

Samples:

L23191-2	83 Top
L23191-3	85 Middle
L23191-4	87 Bottom
L23191-8	95 Top
L23191-9	97 Middle
L23191-10	99 Bottom
L23191-14	125 Top
L23191-15	127 Middle
L23191-16	129 Bottom

Blank: WG51242-101

Reference or Spike: WG51242-102

Duplicate:

Comments:

1. Data are considered final.
2. Data are not blank corrected.
3. In sample 83 Top (Axys ID L23191-2), naphthalene, 2-methylnaphthalene, and 2,6-dimethylnaphthalene could not be quantified, as indicated by the NQ flags. The recovery of d8-acenaphthylene fell below the lower method control limit, as indicated by the V flag. The results are recovery corrected. The recovery of the d8-acenaphthylene is sufficient for the accurate quantification of native acenaphthylene and acenaphthene, the two analytes for which d8-acenapthylene is the internal standard.

(1) Where applicable, custom lab flags have been used on this report.
(2) QC limit is 20% for native compounds with a labeled analog, 35% for those without a labeled analog.

These data are validated and reported as accurate and in accord with AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Where applicable, custom lab flags have been used on this report; U = not detected at RL; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration; B = analyte found in the associated blank and concentration in sample is less than 10X the concentration in the associated blank; J = concentration less than lowest calibration equivalent; NQ = data not quantifiable.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = contract defined limit.
(3) May co-elute with Cyclopenta(cd)pyrene.
(4) May co-elute with Triphenylene.
(5) May co-elute with Dibenz[a,c]anthracene.

These data are validated and reported as accurate and in accord with AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Where applicable, custom lab flags have been used on this report; U = not detected at RL; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration; J = concentration less than lowest calibration equivalent.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = contract defined limit.
(3) May co-elute with Cyclopenta(cd)pyrene.
(4) May co-elute with Triphenylene.
(5) May co-elute with Dibenz[a,c]anthracene.

These data are validated and reported as accurate and in accord with AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

APPENDIX C

Deviations, Protocol, and Amendments

Deviations with Study Impact

None

Deviations with No Study Impact

The protocol stated that the Benzo(a)pyrene concentrations in Groups 8 to 12, the soil extract groups, would be the B(a)P equivalent in ppm of Groups 3 to 7. The nominal B(a)P concentration in Group 10 should have matched the measured concentration in Group 5 which was 1.42 ppm. Due to a calculation error by the Study Director, the nominal concentration for Group 10 was 1.58 ppm. The difference between 1.42 and 1.58 is 10%, which is not considered extreme. Analytical results from the diet mix provide actual values which may be used in to determine B(a)P concentrations rather than any nominal value.

The Protocol on page 8 states that animals would be between the target weights of 22-24 grams at the initiation of dosing. Animal body weights ranged from 21.5-28.3 grams at the initiation of dosing. Actual animal body weights will be used for mass balance equations.

The Protocol on page 8 stated that animals would be provided certified NIH-31 diet as meal, *ad libitum*. Certified Harlan Teklad Global Diet® 2016CM meal was available *ad libitum* from the day of arrival to Day -30. On Day -30, animals were switch to certified Harlan NIH-31 #7017 diet as meal which was available *ad libitum* until Day -16. From Day -16 to Day -9 the animals were switched back to the Certified Harlan Teklad Global Diet® 2016CM meal which was available *ad libitum*. On Day -9 the animals were switched back to certified Harlan NIH-31 #7017 diet as meal which was available *ad libitum* for the remainder of the study. Animals received NIH-31 meal for over a week prior to study and thus can be said to have be thoroughly acclimated to NIH-312 meal prior to study start.

The Protocol on page 8 stated that following randomization, animals were to be housed four per cage, each group in two cages of four animals per cage, in Nalgene® metabolism cages. Following randomization, animals were housed four per cage, each group in two cages of four animals per cage, in Nalgene® metabolism cages from Day -20 to Day -13. Due to delays in the start of dosing, animals were returned to stainless steel wire bottom cages and housed singly

from Day -13 to Day 1. On Day 1 animals were returned to being housed four per cage, each group in two cages of four animals per cage, in Nalgene® metabolism cages. Animals were acclimated to group housing for the week from Day -20 to Day -13. There were no clinical observations indicating difficulties with the group housing arrangement.

All the initial back-up diet formulation analysis samples were added back to the diet for remixing on Day -7. A second set of duplicate samples was collected on Day -1 (approximately 20 g each sample) from the top, middle, and bottom of each test diet preparation. Diet samples were re-mixed and re-sampled at the request of the Sponsor.

The Protocol on page 9 stated that animals were to be randomized into study groups on Day -2, -3, or -4. Animals were randomized on Day -22. This was due to a delay in the start of dosing. Randomization close to study start is performed primarily to ensure that group mean body weights at study start are similar. Despite being randomized three weeks prior to study start group mean body weights were similar between groups with a range from 23.96 to 24.96 grams.

Additional soil samples, ~20 g, were collected at 25 ppm BaP and shipped to the United Kingdom. The in-life portion of the study had completed by the time these samples were shipped.

The Protocol on page 13 stated that urine was to be shipped to the analytical lab on Day 14. The final urine collection was on Day 15 which was the same day urine samples were shipped to the analytical lab. The intent of the protocol was that urine be shipped on its final day of collection. This was accomplished.

The protocol described at ALS Life Sciences would perform analytical analysis of the diet mixtures. ALS was sent samples from all dose groups, performed analytical analysis, and provided results, for samples from Groups 2, 4, 5, 9, and 10. Samples from all dose groups were sent to AXYS which analyzed all samples and provided results for report inclusion. This is a protocol deviation as the protocol-specified analytical laboratory (ALS) did not analyze samples from all dose groups, while a laboratory not specified in the protocol as the laboratory to perform this analysis (AXYS) analyzed diet samples from all groups. Highly variable results and continued analytical issues at ALS prompted an alternate lab for diet mix analysis to be identified. AXYS was identified as an alternate lab and samples were sent to AXYS for analysis.

The protocol on page 12 stated that an additional body weight was to be measured prerandomization (between Days -5 to -1). The prerandomization body weight was collected on Day -8. The intent of the prerandomization body weigth was to evaluate animal's weight prior to study start. Body weights were recorded numerous times prior to study start and so the animal's weights were monitored extensively prior to the first day of dosing.

Introduction

Objective(s)

The objective(s) of this study are to provide urine samples to test analytical methods for analyzing the presence of polycyclic aromatic hydrocarbons in urine.

Sponsor

Arcadis U.S., Inc.

Proposed Schedule of Events

Study Initiation:	Date protocol/study plan is signed by study director
Experimental Start:	On or after April 14, 2015
First Day of Dosing:	On or after April 21, 2015
Last Day of Dosing:	On or after May 6, 2015
Experimental Completion:	The date the last subreport is signed.

Regulatory Compliance

This non-GLP study will be performed according to the protocol and testing facility standard operating procedures.

Test Article and Positive Control

Identification	Test Articles - Sieved soil and extracts in methylene chloride. Positive Control - Benzo(a)pyrene B(a)P

Lot Numbers	HS15010780-17: Clean Soil Sample (Group 1) SLBG9477V: Benzo(a)pyrene B(a)P (Group 2) <u>Soil Test Articles (Groups 3 -7)</u> Group 3: HS15040099 Group 4: HS15040097 Group 5: HS15040080 Group 6: HS15040100 Group 7: HS 15040110 <u>Soil Test Article Extract (Group 8-12)</u> Group 8: FAFB-G1 Group 9: FAFB-G2F Group 10:FAFB-G3 Group 11:FAFB-G4 Group 12:FAFB-G5
Purity/Correction Factor	Test articles and positive control will be used without a correction factor
Bulk Stability	Any available information about bulk stability of either the test articles or positive control will be included in the study file.
Storage Conditions	Positive control to be stored at ambient room temperature. Test article to be stored refrigerated at a target temperature of 2-8°C.
Characteristics	Any information methods, composition, or other characteristics that define the test article or positive control articles, which are supplied by the sponsor/manufacturer, will be included in the final report.
Safety	An MSDS or other suitable document will be provided for the Benzo(a)pyrene (B(a)P). Specific laboratory safety procedures, included appropriate PPE, will be employed when working with the positive control and test articles. A memo detailing safety procedures associated with this study has been generated, circulated, and placed in the study file. .
Retention Sample	No retention sample will be collected.

Accountability	Maintained according to testing facility SOPs
Disposition	Remaining test articles and positive control article may be transferred for use on a future study prior to finalization of the study report, or will be returned to the Sponsor should additional studies not be conducted.

Vehicle Components

Identification	No vehicle to be used. The sieved soil, extracts, or B(a)P will be mixed directly into the diet.

Dose Formulation

Frequency of Preparation	All diets will be prepared once prior to dosing.
Procedures - General	Documented concentrations of B(a)P in soil and extract will be used to calculate PAH concentration in diet preparation (i.e. – B(a)P concentration is to be the proxy for PAH concentration). All calculations used to prepare diets will be provided to the Sponsor Contact for verification prior to diet preparation. Diet preparation will only proceed following approval of all calculations by Sponsor. Duration of mixing for each diet of each group will be recorded and will be a minimum of 15 minutes, with longer durations if deemed necessary. Care will be taken not to grind or otherwise crush soil test articles during mixing. Details of the procedures used will be recorded and included in the final report.

Procedures – General Instructions for Each Group	Sieved soil control test article (Group 1) - The appropriate amount of test article will be incorporated into the remaining amount of meal for that batch in a plastic bag. Positive control test article (Group 2) – Thirty mg of B(a)P will be added to 88 mL methylene chloride. After mixing all 88 mL methylene chloride will be added to 60 grams of NIH-31 diet. After through mixing and evaporation of any methylene chloride, these 60 grams will be added to 1,140 grams of NIH-31 diet and thoroughly mixed for at least 15 minutes. Thirty mg of B(a)P in 1.2 kg will equal a nominal B(a)P concentration of 25 mg/kg/25 ppm (30 mg/1.2 kg = 25 mg/kg). Sieved soil test article (Groups 3-7) – Groups 3 to 7 will all be sieved soil, but each group will be a different sieved soil sample. The appropriate amounts of test article will be incorporated into the remaining amount of meal for that batch in a plastic bag. Extract test article (Groups 8-12) - Groups 8 to 12 will all be extracts of sieved soil, but each group will be an extract from a different sieved soil sample. The extracts in Groups 8-12 will correspond with the soil samples used on Groups 3 to 7. The extract test article will be initially incorporated into diet by applying a predetermined volume of extract in methylene chloride directly to approximately 60 grams of rodent meal using a beaker and mixing spoon. The methylene chloride will be allowed to evaporate from the diet under a hood. The diet prepared as above will be considered a “Stock diet”. The entire amount of this stock diet will be mixed in a plastic bag with the remaining amount of meal for that batch to achieve the 5% (by weight) Soil Test Article diet concentration for B(a)P.
Storage Conditions	Test article and positive control diets to be stored refrigerated at 2-8°C.

Diet Formulation Analysis

Concentration and Homogeneity	The concentration will be determined for each test diet prepared. Prior to analysis, these samples will be stored under monitored refrigerated conditions at a target of 2-8^{o}C. Duplicate samples will be collected (approximately 30 g each sample) from the top, middle, and bottom of each test diet preparation. One set of each of the above duplicate concentration samples will be shipped on with ice packs to the Contributing Scientist, Dose Formulation Analysis. The duplicate sets will be retained at a controlled temperature of 2-8^{o}C as a backup at the Testing Facility (to be discarded or stored or shipped to Sponsor after satisfactory results have been obtained on the first set of samples).
Stability	Stability testing will not be performed.
General	Results from formulation analyses will be included in a dose formulation report, which will be included in the final study report. All remaining dose formulations will be properly discarded when the final dose formulation report is issued or will be shipped to the Sponsor or the Sponsor's designated laboratory.

Test System

Humane Care of Animals

Treatment of the animals (including but not limited to all husbandry, housing, and feeding conditions) will be conducted in accordance with the guidelines recommended in Guide for the Care and Use of Laboratory Animals (National Academy Press, Washington DC, 2011).

Species	mus musculus
Strain	B6C3F1
Source	Charles River Laboratories
History	The animals will be experimentally naïve.

Weight at Initiation of Dosing	Target of 22-24 grams
Number and Sex	96 females, plus 14 extra
Identification	An ear tag with a matching cage card will be used.
Justification	Mice are commonly used in safety evaluation studies that are accepted by appropriate regulatory agencies. The total number of animals used in this study was the minimum required to properly achieve study objectives. This determination was based on historically established conventions in the industry for this type of study.
Receipt and Acclimation	Animals will be received from their source and acclimated to the facility and husbandry conditions according to Facility SOPs. Prior to release to study, health status of the animals will be reviewed by a member of the veterinary staff. Data collected on animals prior to release to study will be maintained as facility records.
Housing/ Sanitation	Upon receipt, animals will be housed singly and in stainless steel wire bottom cages. Following randomization, animals will be housed four per cage, each group in a two cages of four animals per cage, in Nalgene® metabolism cages. Animal room and cage cleaning will be performed according to testing facility SOPs.
Diet	Certified NIH-31 diet as meal will be available ad libitum, except during protocol-specified periods of fasting. Analysis of diet has been performed by the manufacturer and has been certified to be within specifications.
Fasting	The animals will be fasted as noted in subsequent section(s) of the protocol for dosing or data-specific collection periods.
Water	Tap water filtered through a 0.22 µM PES filter will be available ad libitum while mice are in their home cage. Water to be filtered will be supplied by the City of Painesville and is routinely analyzed to monitor chemical and bacterial levels and to determine priority pollutants.

Contaminants	Results of the food and water analyses are reviewed periodically by a staff veterinarian or designee. No contaminants are known to be present in the food or water that may interfere with the results of the study.
Environment	Temperature: 68 – 79°F (20 – 26°C) Humidity: 30 – 70% Light: An alternating 12-hour light/dark cycle will be maintained, except during study-specific procedures. Addition or loss of time due to Daylight Savings time adjustments will not be considered as deviations. Ventilation: The airflow will be set for at least 10 air changes per hour with 100% fresh air (no air recirculation). The environmental conditions of the animal room will be monitored and documented.
Environmental Enrichment/ Supplements	Species-specific enrichment or supplements will be provided per facility SOPs.

Study Design

Randomization	Animals considered healthy and acceptable for study will be assigned to Study Groups using a computer-generated randomization procedure based on body weight. Control for siblings will be performed, if possible. Randomization into study groups will occur on Day -2, -3, or -4. Animals not assigned to study groups will be allocated into a spare group. Spare animals will be released from study on or after Day 1.

Predose	Animals will be acclimated to the study room for a minimum of 7 days prior to initiation of dosing. Animals may be acclimated to study-specific experimental procedures to identify animals which may exhibit increased levels of stress or resistance to the procedure. Animals deemed unfit to receive test or control article based on predose data (including behavioral issues) will be removed from the study group and replaced by a spare animal. Predose data (e.g. veterinary examinations, etc) collected for selection of animals to be randomized to study will be maintained in the study files.
Treatment Groups and Dose Administration	The mice will be assigned to groups as shown in the table below. The first day of administration will be designated as Day 1 of the study.

Group Assignment and Dose Levels

Dose Group	Number of Animals (Female)	Test Article	Test Article Lot Number	Dose Level
1	8*	Sieved soil to 250 µM negative control	HS15010780-17	5% (w/w) of diet
2	8	Benzo(a)pyrene (B(a)P) Positive control	SLBG9477V	25 ppm
3	8	Sieved Soil	HS15040099	5% (w/w) of diet
4	8	Sieved Soil	HS15040097	
5	8	Sieved Soil	HS15040080	
6	8	Sieved Soil	HS15040100	
7	8	Sieved Soil	HS15040110	
8	8	Extract of Group 3 Sieved Soil	FAFB-G1	B(a)P ppm Equivalent of Groups 3-7 (5% of diet)
9	8	Extract of Group 4 Sieved Soil	FAFB-G2	
10	8	Extract of Group 5 Sieved Soil	FAFB-G3	
11	8	Extract of Group 6 Sieved Soil	FAFB-G4	
12	8	Extract of Group 7 Sieved Soil	FAFB-G5	

*All groups of 8 animals will be split into two cages of four animals per cage.

Dose Administration

Dose Administration	Animals will receive the test or positive control articles mixed in their diet for 14 consecutive days. All animals will be terminated the day following completion of dosing.
Route of Administration	All administrations will be given by the oral route as a diet admixture.
Justification of Route	This administration route is consistent with the route of exposure used in “Technical Report for Experiment No. 6722: Chronic Bioassay of Two Composite Samples From Selected Manufactured Gas Plant Waste Sites”, Beland and Culp, 1998

Justification of Dose Levels	Dose levels were selected by the Study Director in agreement with the Sponsor and based on available data including a previously performed pilot study Ricerca # 030947.
Justification of Frequency	The frequency of administration is conventional for studies of this type.

In-Life Observations and Measurements

Viabilities	Animals will be observed for viability at least once in the morning and once in the afternoon, at least 4 hours apart, throughout the study.
Clinical Observations	Daily cageside clinical observations will be performed and recorded at approximately the same time each day.
Detailed Clinical Observations	Detailed clinical observations will be performed prior to randomization.
General	Animals appearing to be in pain or distress will be brought to the attention of the Study Director and/or a staff veterinarian.
Body Weights	Body weights will be measured predose, as needed, to monitor animal body weights. Animal body weights of 22 to 24 grams will be targeted for use on study. Additional body weights will be measured pre-randomization (between Days -5 to -1), and daily for the remainder of the in-life period.
Food Consumption	Quantitatively, at least once predose, and daily for the remainder of the in-life. Food consumption per cage will be divided by four obtain an average food consumption per animal.
Observations for Potential Fecal Contamination	Twice daily observations of the urine collection cups will be performed. Fecal contamination of collected urine will be recorded and feces will be removed if possible. Pictures will be taken daily of pooled urine following transfer to containers used for storage and shipping.

Urine Collection

Sample Collection	Subsequent to the initiation of dosing, daily urine collections will be made from each cage. At each collection urine volume will be measured and documented. Urine samples will be stored frozen in a freezer set to maintain ≤-70 °C, in pre-labeled urine collection vials, until shipment to the analytical lab on Day 14. Samples will be shipped on dry ice. The volume of urine collected each day from each cage will be recorded and reported in the final study report. Should no urine be present in collection cups documentation will be made.

Euthanasia/Necropsy

Morbidity/ Mortality	Animals considered moribund will be euthanized by CO_2 overdose on the day the determination is made.
Unscheduled Necropsy	If an animal is found dead or is euthanized moribund following initiation of dosing, it will be necropsied. If necropsy personnel are not available at the time the animal is found dead or euthanized moribund, the carcass will be refrigerated until necropsy can be conducted. The gross necropsy will be conducted for the purpose of attempting to determine cause of death and will include examination of: All external surfaces and orifices Internal organs and tissues All abnormalities will be described and recorded
Scheduled Necropsy	Following collection of the final in-life samples, all surviving animals will be euthanized by CO_2 overdose and their carcasses will be frozen and retained by Ricerca for up to three months for possible future evaluation. After three months carcasses will be disposed of appropriately or will be shipped to the Sponsor.

Major Computer Systems/Software

The computer systems used on this study may include, but not be limited to, the following systems. All version numbers of the applications, as well as validation or qualification status, are maintained by Ricerca Biosciences, LLC, and will be presented in appropriate sections of the final report.

Application Name	Function
Siemens REMs	Controls environmental systems in vivarium
Edstrom Watchdog	Monitors and records environmental data in vivarium
WinNonLin	Pharmacokinetic analysis system
Provantis	In-life test system data and statistical evaluation
Microsoft Office	Collection of word processing and spreadsheets used for report production
RATS	In-house system used to schedule study activities
SAS	statistical analysis of data within Provantis system

Statistical Analysis

When appropriate, numeric animal data will be evaluated statistically. Data considered to be parametric (continuous data, typically with normal distributions) will be evaluated by analysis of variance (ANOVA) with $p \leq 0.05$. If significance exists, pairwise comparisons of each dose group with the control group will be made using a post hoc test, Bonferroni or Dunnett, ($p \leq 0.05$) to identify statistical differences between each dose level group and control values. Data considered to be non-parametric (discontinuous data or non-normally distributed) will be evaluated using a Kruskal-Wallis Test ($p \leq 0.05$) on ranked data for group significance. If significance exists, pairwise comparisons of each dose group with the control group will be made using a post hoc test Wilcoxon with Bonferroni-Holm adjustment, ($p \leq 0.05$).

Statistical evaluation may not be conducted for particular parameters if there is lack of sufficient data due to excess animal mortality or other pertinent factors.

Animal Care and Use Statement

The research described does not unnecessarily duplicate previous animal experiments and is being conducted in the absence of acceptable non-animal alternatives to accomplish its objectives. The protocol and any amendments or procedures involving the care or use of animals in this study will be reviewed and approved by Ricerca's Institutional Animal Care and Use Committee (IACUC) prior to the initiation of such procedures (i.e., prior to the start of the study for most protocol-specified procedures).

Palliative and Prophylactic Measures

The Study Director, in consultation with a staff veterinarian, may approve palliative and/or prophylactic treatment of animals. Under emergency situations, the Study Director authorizes a staff veterinarian to approve palliative and/or prophylactic treatments; under such circumstances the Study Director and Sponsor will be notified of treatment as soon as possible

Quality Assurance

This is a non-GLP study, and therefore no Quality Assurance audits will be conducted.

Sponsor Review

The Sponsor may send representatives to inspect the study and the premises during normal working hours during the course of the study and/or to review the raw data and the final report.

Protocol Changes and Deviations

Changes to the approved protocol will be in the form of amendments approved by the Study Director and the Sponsor Representative. Amendments will clearly describe the protocol changes and will include the effective date of the change and justification for the change. The Sponsor may authorize protocol changes by telephone or other electronic means when he/she cannot be physically present for signature. Protocol deviations will be noted in the study records and reported.

Records

Following completion of analysis and prior to completion of the final report, all materials generated at Ricerca Biosciences, LLC, including raw data and final report and any biological and formulation samples will be shipped to the Sponsor.

External test sites will be responsible for archiving data produced at their own sites.

Reporting

The Study Director will prepare a final report of the study results. This report will include a comprehensive presentation of data, as well as interpretations of the data. The name and address of the facility conducting the study and dates on which the study was initiated and completed will be included in the report.

PROTOCOL AMENDMENT
Number One

Study Title

Main Study: Foster AFB : Fourteen-Day Diet Mix of Soil and Soil Extracts in Mice

Study Number: **031705**

Testing Facility:
Ricerca Biosciences, LLC
Drug Safety and Metabolism
7528 Auburn Road
Concord OH 44077

Additions/changes are in bold underlined text.
Deletions are in strike through.

Page 4 of Final Protocol

Urine Collection

Lot Numbers	HS1501~~4~~**4**0**0**780-17: Clean Soil Sample (Group 1)
	SLBG9477V: Benzo(a)pyrene B(a)P (Group 2)
	Soil Test Articles (Groups 3 -7)
	Group 3: HS15040099
	Group 4: HS15040097
	Group 5: HS15040080
	Group 6: HS15040100
	Group 7: HS 15040110
	Soil Test Article Extract (Group 8-12)
	Group 8: FAFB-G1
	Group 9: FAFB-G2F
	Group 10:FAFB-G3
	Group 11:FAFB-G4
	Group 12:FAFB-G5

Rationale

The original protocol listed an incorrect lot number for the clean soil group.
